1. Executive Summary

The City of Guelph (City) retained CH2M HILL Canada Limited (CH2M), now Jacobs Engineering Group Inc. (Jacobs), to provide environmental services for the properties located at 55 Baker Street, 152 Wyndham Street North, 160 Wyndham Street North, and the right-of-way known as Park Lane in Guelph, Ontario (Phase Two Property or Site). Jacobs understands the current plan is to redevelop the Site for a mix of residential, commercial, community, and institutional use.

The Site is in downtown Guelph, southwest of the Speed River (Figures 2-1 and 2-2a). It is approximately 1.14 hectares (ha) in size, is currently used as a commercial parking lot, and includes one laneway. There are no buildings onsite; however, buildings were historically present and associated with the use of portions of the Site for parkland, commercial, and industrial purposes. From approximately 1827 to 1879, the parcel associated with 55 Baker Street was used as a public burial ground (community land use) (Pinchin 2018).

Jacobs developed the field program for the Phase Two Environmental Site Assessment (ESA) based on the results of the Phase One ESA (Pinchin 2018), as well as the results of previous environmental investigations (Kewen 2001; XCG 2008), to provide general spatial coverage across the Site. The field components of the project included utility locates, archaeological clearances, drilling and monitoring well installation, soil and groundwater sampling, surveying, and water level elevation measurements. Jacobs and its subcontractors completed these field components, which are documented in this report.

This report was completed to summarize Phase Two investigations conducted at the Site, and to complete the following tasks:

- Meet current Ontario Regulation (O. Reg.) 153/04 (MECP 2011a), regulatory requirements to support Record of Site Condition (RSC) filing.
- Investigate or further investigate areas of potential environmental concern (APECs) identified during the Phase One ESA (Pinchin 2018).
- Provide data to support a potential risk assessment (RA).

According to Section 168.3.1 of the *Environmental Protection Act* (MECP 1990a), an RSC is required because the land use will be changed from commercial to a mixed land use that includes more sensitive uses (that is, residential or institutional, or both).

To assess the subsurface conditions, Jacobs examined the lithologies recorded from 27 investigative locations (that is, boreholes and monitoring wells) advanced as part of the current Phase Two ESA activities. Geological conditions, as characterized from the dataset at the Phase Two Property, include the following:

- Asphalt at ground surface (extending to 0.15 metres below ground surface [mbgs]).
- Fill materials (mainly sand, sand and gravel or silty sand) to a maximum depth of 3.91 mbgs, with an average thickness of 1.87 metres (m).
- Native overburden (sand) that exists roughly from the bottom of fill to the bedrock, with interbedded layers
 of gravel and silt.
 - A silt layer was encountered in the northern portion of the Site. The depth to silt ranged from 2.13 to 3.94 mbgs and the average thickness of the layer was 3.58 m. In most locations where the silt was encountered, it underlay a layer of sand and directly overlies bedrock.
 - A small silt lens, observed in the southern portion of the Site, was disconnected from the larger silt layer in the northern portion of the Site. The depth to this silt layer ranged from 2.21 to 3.72 mbgs, with an average thickness of 1.37 m.

- A gravel and sand layer was encountered in the southern portion of the Site. The depth to this gravel and sand layer ranged from 1.52 to 5.94 mbgs, and the average thickness of the layer was 2.16 m. Generally, the sand and gravel extends to the bedrock, but in the southeastern portion of the Site it terminates above a layer of sand.
- A clay lens was encountered in the middle of the Site (MW109). The clay was encountered from 1.14 to 2.44 mbgs, which is generally consistent with the depth of the fill layer and is expected to be very small laterally.
- Guelph Formation dolostone with a top of bedrock contact ranging from 4.57 to 8.46 mbgs (average depth at 5.99 mbgs); the bedrock was described as being highly weathered and fractured within the first 0.3 to 0.6 m, and was noted to be vuggy, with calcite mineralization.

Local groundwater is expected to flow eastward, toward the Speed River. The Site-specific groundwater was interpreted to flow radially, from a high elevation on the western boundary of the Site towards the north, and east to southeast. The higher groundwater elevations at the western portion of the Site appear to be correlated with higher bedrock elevation. Perched groundwater is also observed at the northern end of the Site, above the low-permeability silt aquitard layer. The full extent of the perched groundwater is currently not fully understood but may have a similar extent to the silt layer.

Based on the available information, Jacobs selected the Table 2 Site Condition Standards (Table 2 SCS), as outlined in the Ontario Ministry of the Environment, Conservation and Parks' (MECP's) *Soil, Groundwater, and Sediment Standards* for Use under Part XV.1 of the *Environmental Protection Act* adopted under Ontario Regulation 153/04 (MECP 2011c) for a potable groundwater, residential/parkland/institutional property use for coarse-textured soil to apply to the Site.

Most of the soil beneath the Phase Two Property was found to be impacted with salt-related parameters (electrical conductivity [EC] and sodium adsorption ration [SAR] in soil; and sodium and chloride in groundwater). Limited localized metal impacts were also present (lead and mercury in soil; cadmium in groundwater).

The presence of elevated EC and SAR in soil and sodium, as well as chloride in groundwater, is widespread across most of the Site and is interpreted to be related to the application of deicing materials on the parking lot surfaces (APEC-4). Section 49.1 of O. Reg. 153/104 states the SCS is deemed not to be exceeded for the purpose of Part XV.1 of the Environmental Protection Act when a substance that has been applied to surfaces for the safety of vehicular or pedestrian traffic under conditions of snow or ice, or both, exceeds the SCS. Therefore, at the discretion of the Qualified Person for Environmental Site Assessment (QPESA) and based on the revised regulation, these parameters were not considered to be contaminants of concern (COCs) at the Phase Two Property.

Metals exceedances in soil were identified in the southeastern portion of the Phase Two Property at one location (MW101), and were limited to lead and mercury. These impacts are likely limited to the fill in the existing laneways, based on results and observations during drilling and test-pitting activities, and extend to an estimated maximum of 3.0 mbgs based on fill depth in this area. The poor-quality fill was not observed at other locations.

Metals exceedances in groundwater were limited to cadmium. Cadmium exceedances were noted in two monitoring wells along the western property boundary (MW107 and MW113) with maximum concentrations found at MW113 screened in the bedrock aquifer (at 5.3 to 8.4 mbgs). The cadmium exceedances at these locations were not shown to extend vertically to MW107B (screened in the deep bedrock, at 13.7 to 15.5 mbgs). Groundwater moves from these locations towards the southeastern portion of the Site. Sampling results from downgradient wells from the identified cadmium exceedances (MW110A and MW101, both less than the Table 2 SCS) indicate the cadmium impacts in groundwater are not anticipated to migrate offsite. Cadmium impacts may

be related to the APECs associated with offsite and upgradient potentially contaminating activities (to the west) (for example, APEC-11 for Industrial Operations and APEC-12 for Historical Automotive Garage) or other unknown sources.

Based on extensive sampling over the Phase Two Property, it has been concluded that the horizontal and vertical extents of soil and groundwater impacts have been sufficiently defined for Phase Two purposes, as well as to support the RA and evaluation of risk management measures.

Jacobs completed an RA (Jacobs 2020) to assess the existing concentrations of COCs on Site, develop property-specific standards, and determine what risk management measures would need to be implemented. The RA (MGRA1896-20, IDS# 7882-BRYP6L) was accepted by the MECP on December 21, 2020.

Based on the results of the Phase Two ESA, as of the certification date of April 29, 2020, the concentrations of contaminants in soil and groundwater at the Phase Two Property meet the property-specific standards as defined in the RA (Jacobs 2020). An RSC can be developed and submitted to the MECP, to permit the proposed change in land use for the Site.

2. Introduction

The City of Guelph (City) retained Jacobs Engineering Group Inc. (Jacobs), to provide environmental services for the properties located at 55 Baker Street, 160 Wyndham Street North (including the former 152 Wyndham Street North), and the right-of-way known as Park Lane in Guelph, Ontario (Phase Two Property or Site) (Figure 2-1).

The Site is in downtown Guelph, southwest of the Speed River (Figure 2-1). The Site is approximately 1.14 hectares (ha) and is currently in use as a commercial parking lot and one laneway. There are no buildings onsite; however, buildings were historically present and associated with the use of portions of the Site for parkland, commercial, and industrial purposes. Figures 2-2a and 2-2b show building outlines and identified utilities, respectively, on the Phase Two Property. From approximately 1827 to 1879 the parcel associated with 55 Baker Street was used a public burial ground (community land use) (Pinchin 2018).

The Site underwent various subsurface environmental investigations between 1993 and 2019. The objectives of the Phase Two Environmental Site Assessment (ESA) are to:

- Meet current Ontario Regulation (O. Reg.) 153/04, (MECP, 2011a), regulatory requirements to support Record of Site Condition (RSC) filing.
- Investigate or further investigate areas of potential environmental concern (APECs) identified during the Phase One ESA (Pinchin 2018).
- Provide data to support a potential risk assessment (RA).

This report is also intended to support the future redevelopment of the Phase Two Property. Jacobs understands the current plan is to redevelop the Site for a mix of residential, commercial, community, and institutional use (City 2019).

2.1 Site Description

The Phase Two Property is approximately 1.14 ha, and is surrounded by a mix of commercial, institutional, and residential land uses. The Site is south of Woolwich Street, east of Baker Street, north of Quebec Street, and west of Wyndham Street North. Exhibit 2-1 identifies the municipal address, property identifier numbers, and legal descriptions of the parcels that form part of the Phase Two Property.

Exhibit 2-1. Property Information

Municipal Address	Property Identification Number	Legal Description
55 Baker Street	71287-0119 (LT) ^a	Part Burying Ground; Plan 8; Part Lane through Burying Ground; Plan 8, Closed by MS80255; as in MS78644, MS20082, CS58221; subject to Interest, if any, in CS58221; Part Burying Ground, Plan 8 as in CS51962; City of Guelph
N/A (Park Lane)	71287-0099 (LT)	Unnamed Lane, Plan 8, (AKA Park Lane, Plan 8) lying south of Part Closed by CS31228, Save and Except RO755787, ROS546721 & ROS220056; Guelph

Exhibit 2-1. Property Information

Notes:

N/A = not applicable

Appendix A includes the Plan of Survey for the Site.

2.2 Property Ownership

The City currently owns the Phase Two Property; Exhibit 2-2 presents contact information for the owner.

Exhibit 2-2. Contact Information for Owner of Phase Two Property

Agency	Role	Contact Information
City of Guelph	Owner Representative	Prasoon Adhikari, M.Sc., P.Eng., PMP Environmental Engineer City of Guelph, Engineering and Transportation Services, Infrastructure, Development and Environmental Engineering 1 Carden Street Guelph, Ontario, N1H 3A1 Ph: 519.822.1260 ext. 2946 Email: Prasoon.Adhikari@guelph.ca

2.3 Current and Proposed Future Uses

The Phase One ESA (Pinchin 2018) provides current and historical information about the Phase Two Property. The Site currently consists of a paved municipal parking lot and a paved laneway. Most of the Site is currently operating as a paid parking lot. Jacobs understands the current plan is to redevelop the Site for a mix of residential, commercial, community, and institutional use.

According to Section 168.3.1 of the *Environmental Protection Act* (MECP 1990a), an RSC is required because the land use will be changed from commercial to a mixed land use that includes more sensitive uses (that is, residential or institutional, or both).

^a Recently consolidated from former PIN numbers 712870038 (LT) and 71287-0058 (LT)

^b Recently consolidated from former PIN numbers 712870044 (LT) and 712870045 (LT); the latter being associated with former municipal address 152 Wyndham Street North

2.4 Applicable Site Condition Standards

O. Reg. 153/04 (MECP 2011a), under Part XV.1 of the *Environmental Protection Act*, addresses the assessment, cleanup, and filing of an RSC for brownfield sites in Ontario and applies to the Phase Two Property. Jacobs evaluated the Site based on several criteria to decide which of the generic standards in the Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the *Environmental Protection Act* (MECP 2011b) applied for a comparison of soil and groundwater results from the Phase Two ESA investigation.

The items in Exhibit 2-3 were considered during the selection of the standards, as outlined in O. Reg. 153/04 (MECP 2011a).

Exhibit 2-3. Items Considered for Site Condition Standards Selection

Condition	Evaluation
Land use	The current land use is commercial and community. The proposed future land use is a mix of residential, commercial, community, and institutional.
Potable or non-potable groundwater	The Site and adjacent properties within 250 m are serviced by a municipal water source. However, as the City relies on groundwater for its water supply (City 2018), the potable groundwater condition will be applied.
Proximity to surface water body	No waterbodies are located on the Site. The Speed River is the nearest downgradient waterbody, and is located approximately 130 m northeast of the Site.
Proximity to areas of natural significance or environmentally sensitive areas	The Site is not considered an area of natural significance or to be within the proximity of an area of natural significance, based on the information reviewed as part of the Phase One ESA (Pinchin 2018, Jacobs 2021).
Depth to bedrock	A property is considered a shallow soil property if one-third or more of the area consists of soil depths of 2 mbgs or less, excluding nonsoil surface treatment (that is, asphalt, concrete, or aggregate) (MECP 2011a). The depth to bedrock is greater than 2 m, as bedrock was encountered between 4.93 mbgs and 8.43 mbgs.
pH of soil	Jacobs' investigations included 45 soil samples analyzed for pH from 17 locations across the Phase Two Property and reported soil pH ranged from 7.37 to 9.46 (Figure 2-3). Soil pH was within the MECP's acceptable range for samples collected in both surface soil (from between surface and 1.5 mbgs, with a pH value in surface soil less than 5 or greater than 9) and subsurface soil (more than 1.5 mbgs with a pH value in subsurface soil less than 5 or greater than 11).
	Historical investigations identified elevated pH (greater than 9) in surface soil; however, many of the borehole logs reported brick fragments or concrete present in the soil descriptions where samples with elevated pH were collected. This information suggests that nonsoil materials may have been sampled, potentially biasing the historical soil pH results. Therefore, the historical results may not be representative of actual soil pH conditions.
	Considering this information, Jacobs has relied solely on the soil pH data collected during recent investigation to determine the applicable SCS for soil pH. On this basis, soil pH is within the MECP's acceptable range.

Exhibit 2-3. Items Considered for Site Condition Standards Selection

Condition	Evaluation	
Soil texture	The soil condition standards for coarse-grained soils were used, based on the grain-size results, to be conservative and to account for the extensive presence of heterogeneous fill materials across the surface of the Site.	

Notes:

m = metre(s)

mbgs = metre(s) below ground surface

MECP = Ontario Ministry of the Environment, Conservation and Parks

SCS = Site Condition Standard

Based on this information, which has been reviewed by the Qualified Person for ESA (QPESA), the Table 2 Full Depth Generic Site Condition Standards in a Potable Ground Water Condition for coarse grained soil and residential/parkland/institutional land use (Table 2 SCS), as outlined in the MECP's Soil, Groundwater, and Sediment Standards for use under Part XV.1 of the Environmental Protection Act adopted under O. Reg. 153/04 (MECP 2011b) was applied to the Site.

3. Background Information

3.1 Physical Setting

The topography over most of the Phase Two Property is moderately flat, with ground surface elevations ranging from 328.34 metres above sea level (masl) (MW113) at the southwestern corner of the Site to 330.16 masl (BH201) in the west. The Site slopes slightly from the western border towards the south, north, and east. Surface runoff at the Phase Two Property is expected to flow radially from the west in these directions, but is directed towards onsite catchbasins. Figure 3-1 shows the regional topography and surface water drainage features.

The Phase Two Property is not within 30 m of a water body. The Speed River is the nearest downgradient waterbody, approximately 130 to 150 m north-northeast of the Site, and ground surface tends to slope north towards the river. Groundwater from the region is likely to eventually discharge to Speed River. Based on the information reviewed as part of the Phase One ESA (Pinchin 2018, Jacobs 2021), the Site is not considered part of an area of natural significance or to be within the proximity of an area of natural significance.

The City categorizes regions of Guelph within Wellhead Protection Areas (City 2012). The Site is within Wellhead Protection Area B (2-year travel time) for several of the City's municipal water supply wells.

The nearest municipal groundwater supply wells to the Site include the Water Street, Edinburgh, Membro, and Dean Wells (approximately 1.4 to 2.0 kilometres [km] south of the Site past the Eramosa River), and the Park and Emma Wells (approximately 1.3 to 1.5 km north of the Site past the Speed River).

The municipal groundwater resource is drawn primarily from the Gasport Formation, estimated to occur at least 45 mbgs. A lower-permeability Reformatory Member and Vinemount Member of the Eramosa Formation are generally understood to serve as a regional aquitard, situated above the Gasport and limestone formations of the Goat Island Formation (Brunton 2009). The source of some of the water in the Gasport Formation is through slow recharge across the aquitard from the shallow bedrock groundwater.

The City is also part of the Grand River Source Protection Plan (Plan) (Lake Erie Region Source Protection Committee 2019). The Plan assigns Drinking Water Threat Vulnerability Scores across the region based on various risk factors, and the Phase Two Property is assigned a Vulnerability Score of 10, the highest possible. According to the Plan mapping (Figure 3-2), the Site is also in a highly vulnerable aquifer and issues-contributing area, but is not in a significant groundwater recharge area or in a source water intake protection zone.

3.2 Past Investigations

Before the current Phase Two investigation, three subsurface investigations took place at the Site in 1993 (XCG), 2001 (Kewen), and 2008 (XCG). Table 3-1 summarizes the following tasks associated with each investigation:

- Completion of field program associated with each historical subsurface investigation, including the analyses conducted in soil, groundwater, or both.
- Comparison of the historical subsurface investigation results to the current SCS.
- Evaluation of whether data or information from the historical subsurface investigation are considered reliable for inclusion in the current Phase Two ESA for RSC purposes.
- Completion of tasks to confirm or update data or information not considered reliable.

In general, Jacobs noted the following observations during this evaluation:

- Parameters, such as benzene, toluene, ethylbenzene, and xylenes (BTEX); and volatile organic compounds (VOCs), were characterized more adequately by current standards, using appropriate sample collection and laboratory analysis methods. BTEX and VOC analyses from before 2004 are considered unreliable because of changes in analytical methods.
- Historical laboratory scans for metals did not include complete parameter group analyses in accordance with the current requirements of O. Reg. 153/04. Missing metal parameters have the potential to be contaminants of concern (COCs) on the Site.
- Groundwater concentrations older than 10 years from the commencement of the Phase Two ESA activities were considered not representative of current conditions.
- The results from previous investigations in areas reported to be remediated (specifically, polychlorinated biphenyls [PCBs] in the transformer area) may not represent current conditions.

Where these observations were noted, a portion of the historical data could not be fully relied upon to reflect current environmental conditions at the Site. Therefore, Jacobs used these data for screening purposes during the Phase Two ESA to focus on certain areas to resample and assess the possible presence of contaminants (refer to Section 6.6). The screening data were not used in the final Phase Two ESA dataset to confirm concentrations meeting the applicable standards in APECs, nor were they used to confirm maximum concentrations on the Phase Two Property.

As Table 3-1 specifies, the following soil and groundwater data from the historical investigations were unreliable for RSC purposes:

- Elevated concentrations of PCBs in the former transformer area (XCG 1993) had been reported by Kewen (2001) to have been remediated in 1998. Documentation, including the confirmatory sampling of these activities, was not provided to Jacobs. The 1993 PCB data were therefore excluded from the Phase Two ESA dataset, but used for the focus of the Phase Two ESA investigations (the location was resampled in November 2019).
- Soil data from 2001 (Kewen 2001) are not considered valid for RSC purposes due to historical laboratory methods and incomplete parameter group analyses. Data were used for screening purposes for the Phase Two ESA investigations, and areas of historical impacts were resampled to confirm the presence or absence of contaminants.
- Soil pH data from the XCG (2008) investigation were not considered valid, because a review of borehole logs indicates concrete or brick fragments may have been included in soil samples submitted for pH. Therefore, soil pH results may be biased high and not representative of actual conditions. Additional soil analysis across the Site for pH was included as part of the Phase Two ESA investigations.
- Historical groundwater data (Kewen 2001; XCG 2008) were not considered representative of current Site
 conditions and, therefore, not reliable for RSC purposes. Additional groundwater sampling was conducted
 across the Site as part of the current investigation, including areas where historical groundwater
 exceedances were reported.

The soil data from the XCG (2008) investigation are considered valid for RSC purposes. Sampling and laboratory analyses were conducted in accordance with the requirements of O. Reg. 153/04 at the time, which did not include uranium. Uranium has not been specifically identified as a COC for the Site; as such, the remaining metals analyses from the XCG (2008) investigation are considered usable and reliable. Additional soil sampling for metals, including uranium, took place across the Site as part of the Phase Two ESA investigation.

4. Scope of Investigation

4.1 Overview of Site Investigation

Jacobs conducted Phase Two ESA field activities between July 2019 and April 2020 to evaluate the subsurface environmental conditions at the Phase Two Property, and to investigate the APECs identified in the Phase One ESA (Pinchin 2018). As part of the Phase One ESA, Pinchin identified areas where potentially contaminating activities (PCAs) have occurred on the Phase Two Property and on lands within 250 m of the Phase Two Property. PCAs occurring on the Phase Two Property were subsequently carried through the investigation as APECs, as required by O. Reg. 153/04. Jacobs has reinterpreted some of the APECs identified by Pinchin and also identified additional APECs based on a review of fire insurance plans (FIPs). These changes were documented in an update to the Phase One ESA report (Jacobs 2021), completed to support RSC filing. Further details on the PCAs and APECs are provided in Section 6.10.

The Pinchin (2018) Phase One ESA and Jacob (2021) Phase One ESA Update identified 22 APECs on the Phase Two Property, eight of which are attributed to onsite PCAs and 14 which are attributed to offsite PCAs. These APECs and PCAs were the focus of the Phase Two ESA activities. Figures 4-1a and 4-1b show the onsite and offsite PCAs, respectively, along with the resulting APECs on the Phase Two Property. Figure 4-2 shows the APECs identified in the Phase One ESA for the Phase Two Property, as well as the Phase Two ESA investigation locations.

The principal objective of the Phase Two ESA is to enable the assessment and update of current Site conditions, to identify general and current subsurface impacts that will need to be managed during Site redevelopment. The Phase Two ESA activities included the following main tasks:

- Arrange for public and private underground utility locates.
- Arrange for related to the historical use of the Site as a burial ground.
- Develop a Sampling and Analysis Plan (SAP) based on Phase One ESA findings and historical subsurface investigations.
- Drill boreholes during several field events:
 - July to August 2019 Jacobs advanced 17 boreholes (BH200 through BH206 and MW100, MW101, MW102A, MW102B, MW103 through MW105, and MW107 through MW109) to a maximum depth of 13.64 mbgs. Soil samples were collected for chemical analysis. Ten boreholes were completed as monitoring wells.
 - September to December 2019 Jacobs advanced eight boreholes (BH208 through BH211 and MW107B, MW110A, MW110B, MW111) to a maximum depth of 15.54 mbgs. Soil samples were collected from 5 of the locations. Four boreholes were completed as monitoring wells.
 - April 2020 Jacobs advanced two boreholes (BH2017 and MW113) to a maximum depth of 8.38 mbgs. Soil samples were collected and one borehole was completed as a monitoring well.
- Collect at least two rounds of groundwater samples from the newly installed monitoring wells for COCs to address identified APECs.
- Conduct single-well hydraulic tests on five monitoring wells to improve the understanding of the subsurface materials' hydraulic properties across the Phase Two Property.
- Determine the applicable SCS.
- Survey the monitoring wells to a geodetic benchmark.

Figure 4-2 shows the locations of the borings and wells advanced as part of this Phase Two ESA, as well as during historical investigations. The results of historical environmental studies were used as a screening method to focus the current Phase Two ESA work. Where reliable (refer to Section 3.2), the historical results were used to supplement the Phase Two ESA results. In general, the historical soil data from 2008 were considered valid for inclusion in this Phase Two ESA.

4.2 Media Investigated

Soil and groundwater were the only media investigated during this Phase Two ESA work. The investigation of sediment was not applicable due to the absence of surface water bodies on the Site.

Soil quality at the Site was determined using various sampling techniques, including test-pitting and conventional hollow-stem drilling methods. The selected method was determined based on sample depth, likely subsurface conditions, overhead access, and space for drilling equipment. Section 5 provides further detail regarding soil sampling methods. Section 6 provides soil sampling results.

Groundwater samples from newly installed monitoring wells, as well as existing monitoring wells, were collected and submitted for analysis. The sampling method for groundwater used low-flow purging and sampling techniques (for example, peristaltic pump, water quality meter, and dedicated tubing) based on the turbidity of the samples and analysis required. Section 5 provides further detail regarding groundwater sampling methods. Section 6 provides results of the groundwater sampling.

4.3 Phase One Site Conceptual Model

Table 4-1 summarizes the Phase One conceptual site model from the Pinchin (2018) Phase One ESA, supplemented with additional information from Jacobs. An update to the Phase One ESA will be required before the RSC is filed. Table 4-2 summarizes the identified APECs and the COCs associated with each APEC used as the basis for the Phase Two ESA investigation.

4.4 Deviations from Sampling and Analysis Plan

Before the investigation at the Phase Two Property was completed, a detailed SAP was prepared. Appendix B provides the SAP that applies to the work Jacobs has completed at the Site. No deviations occurred from the project SAP over the course of the Phase Two ESA activities.

4.5 Impediments

The main impediment during the Phase Two ESA was the presence of utilities, both overhead and underground, in areas where borings and wells were planned. As such, borehole and monitoring well locations were adjusted to maintain safe distances from overhead power and cable lines, and underground sanitary and storm sewer locations. Figure 2-2b shows identified utilities on the Phase Two Property. However, all borings and wells were installed in the areas where sampling was planned.

In addition, as the Site is an active parking lot, including laneways, managing vehicle traffic required additional planning during the investigation; however, all planned investigation locations was completed.

5. Investigation Method

5.1 General

Various environmental field and subsurface investigation methods were used to assess soil and groundwater quality during the Phase Two ESA, including:

- Test pits for archeological investigation and soil sampling, including field screening measurements and observations
- Drilling with soil sampling, including field screening measurements and observations
- Installing groundwater monitoring wells and groundwater sampling
- Analytical testing of soil and groundwater samples
- Managing investigation-derived waste
- Implementing quality assurance (QA) and quality control (QC) measures, including the collection and analysis of field duplicate (FD) and trip blank samples

The Phase Two ESA activities were guided by individual SAPs for each investigation (Appendix B). The SAP was designed to investigate the contaminants of potential concern (COPCs) within of the APECs identified as a part of the Phase One ESA (Pinchin 2018) review.

Figure 4-2 shows the sampling locations associated with the Phase Two investigation.

Jacobs retained third-party contractors to conduct or assist with field investigations. Jacobs field staff, under the direction of the project QPESA, supervised field activities and recorded field activities, soil characteristics, groundwater sampling results, and other general field investigation notes.

Jacobs developed standard operating procedures (SOPs) and field forms to comply with O. Reg. 153/04 (MECP 2011a). The SOPs guided Jacobs staff in conducting, performing, and documenting Phase Two ESA investigative work. The following is a list of Jacobs SOPs relevant to the Phase Two ESA activities at the Site:

- Decontamination of Heavy Equipment
- Decontamination of Field Sampling Equipment
- Logging of Soil Borings
- Measurement of Soil Vapour Headspace
- Soil Sampling for VOCs using Methanol Preservation
- Installation of Shallow Monitoring Wells
- Water Level Measurements
- Aquifer Testing Slug Tests
- Monitoring Well Development
- Groundwater Purging and Measurement of Field Parameters
- Low Flow Groundwater Purging and Sampling
- Sample Packaging, Storage, and Transport to Laboratory

The methods employed did not deviate from the SOPs and are described in detail in the following subsections.

5.2 Drilling and Excavating

Before drilling activities, borehole and monitoring well locations required archeological clearance of the upper soils to confirm the absence of items of archeological significance. As areas of the Site had previously been used

as a burial ground, the clearances were required to confirm human remains or artifacts were not present in the drilling locations before drilling activities. Archeological Research Associates Ltd. (ARA) was present onsite to complete the archeological investigation alongside Jacobs staff who collected samples of the fill (and upper native soils, where present) during excavations. ARA prepared a report noting the items found during the archeological excavations and clearing the locations for further drilling work (ARA 2020).

Drilling was conducted at the Site to facilitate the evaluation of subsurface conditions via the collection of environmental samples. Jacobs retained Aardvark Drilling Inc. (Aardvark) of Guelph, Ontario, to undertake drilling activities at the Site for the field program. Aardvark is an MECP-licensed driller. A CME truck-mounted hollow-stem auger rig was used to advance boreholes. Drilling activities were completed under the supervision of Jacobs field personnel. The frequency of soil sample collection for field screening and for submission for chemical analysis is detailed on the borehole logs included in Appendix C. All drilling equipment was decontaminated in accordance with the SOPs.

5.2.1 Utility Locates

Before excavation and drilling activities began for each field event, Jacobs contacted Ontario One Call to arrange clearances of public utility services, including:

- Telephone
- Cable television
- Natural gas
- Hydroelectricity
- Water
- Sanitary lines
- Storm sewers

As an additional precaution, Jacobs also retained OnSite Locates Inc. (OnSite), a private utility contractor located in Newmarket, Ontario, to clear all proposed drilling locations of the same private utility services by using radio detection and electrical isolation for utilities. The resulting locate clearance documents were retained at the Site by Jacobs for the duration of the drilling activities.

5.3 Soil Sampling

Archeological test pits were advanced using a Case 580 backhoe to varying depths at the discretion of ARA representatives. Test pits ranged from approximately 1.0 to 2.2 mbgs. Soils from the test pits were excavated on a layer-by-layer basis to allow for proper sample collection and documentation. Test pits were backfilled, soils compacted, and areas asphalted before drilling. Care was taken to place soils back into the test pit in reverse order of how they were removed. Soil documentation and sampling was completed using the same methods of collection as the drilling investigation.

Soil borings were advanced using a hollow-stem auger CME rig. Boreholes were advanced to bedrock, and rock coring was completed to facilitate monitoring well installation. Final borehole depths completed across the Site were variable and ranged between 4.72 and 13.94 mbgs. Final depths depended on the actual subsurface conditions encountered at the time of drilling.

During the advancement of each soil boring using hollow stem auger methods, samples were collected using 0.61-m-long, 50-millimetre (mm)-outside-diameter split-spoon samplers.

Once the soil sample sleeve was extracted from the hollow-stem auger, a drilling contractor representative opened the split spoon to expose the soil. Once a new soil layer was exposed during excavation, the operator

collected a bucket of soil from the new layer to be examined and sampled. The soil was then examined in the field by Jacobs field staff for:

- Soil type
- Discolouration
- Olfactory evidence or signs of impacts
- General soil properties

Soil samples to be analyzed for petroleum hydrocarbon (PHC) Fraction (F)1 or F2, VOCs, or BTEX were collected using laboratory-supplied soil syringes; the soil core was then placed in vials containing methanol. New, disposable nitrile gloves were used when handling samples from different depths at the same sample location to minimize the potential for sample cross-contamination.

The following soil types were identified during the investigation:

- Fill
- Sand with silt
- Sand
- Sand and gravel
- Silty sand and sandy silt
- Gravelly silty sand
- Clayey sandy silt till

Appendix C provides borehole logs. These logs provide a geological description of overburden samples collected during the investigation.

Collected soil samples were split for field screening and potential laboratory analysis. Field screening was conducted as described in Section 5.4.

5.4 Field Screening Measurements

Collected samples were divided into two portions: one for field vapour screening and the other for laboratory submission (which were immediately placed in the appropriate laboratory-supplied sample containers). The soil samples for field vapour screening were placed in a clean, self-sealing, plastic bag, labelled, and set aside to equilibrate to approximately 15 degrees Celsius (°C) for conducting head space screening using a MiniRAE 3000 photoionization detector (PID). Soil vapour headspace and ambient measurements, as well as instrument calibration, were performed per the SOP.

The frequency of field screening measurements during the intrusive drilling investigation was typically at 0.6-m intervals. During the archeological test pits, field screening measurements were collected at a frequency of at least one per material type. Frequency and results of soil vapour headspace measurements in parts per million (ppm) were also recorded in the borehole logs included in Appendix C, as discussed in Section 6.5.

Field staff used the MiniRAE 3000 PID equipped with an 10.6-electron-volt (eV) discharge lamp for field screening. The MiniRAE 3000 has a detection range of 0 to 2,000 ppm. The accuracy of the unit is ±2 ppm or 10 percent of the reading for readings of 0 to 2,000 ppm. The resolution of this unit is 0.1 ppm for readings less than 99 ppm, and 1.0 ppm for readings between 100 and 2,000 ppm.

Isobutylene, at a concentration of 100 ppm, was used as the calibration gas, and the instruments were calibrated according to the manufacturer's recommendations prior to use each day. Each instrument's calibration was checked by exposing the instrument to the calibration gas with a known concentration and comparing with the actual reading.

Field screening techniques were used during the Phase Two ESA to identify soils impacted by volatile compounds, such as VOCs, certain polycyclic aromatic hydrocarbons (PAHs), and PHCs. The field screening techniques included visual and olfactory observations and the use of a PID to measure soil vapour headspace concentrations. The field screening results guided the selection of soil samples per the SAPs (for example, the collection of worst-case or delineation samples).

Sections 5.1 and 5.3 summarize the measures taken to minimize the potential for cross-contamination during soil sampling.

5.5 Groundwater: Monitoring Well Installation

As part of this investigation, Aardvark installed monitoring wells according to the requirements specified in O. Reg. 903 (MECP 1990b), in a subset of the advanced soil borings, to assess groundwater quality and to assist in determining groundwater flow rates and directions at the Phase Two Property. Section 5.2 describes the drilling equipment used for monitoring well installation.

The monitoring wells were installed so the screened portion straddles and intercepts seasonal fluctuations at the water table, unless otherwise indicated by the SAP (for example, monitoring wells in perched groundwater). The saturated screen thickness of each well did not exceed 3.05 m. Each monitoring well was constructed per the SOP. The monitoring well construction consisted of the following:

- Approximately 5-centimetre (cm)-diameter, Schedule 40 polyvinyl chloride (PVC) risers
- 5-cm-diameter, Schedule 40, No. 10 slot PVC screen with a preferred screen length of 3.05 m (variations in screen length occurred)
- Appropriate sand pack to 0.3 m above top of screen
- 0.6 m of bentonite seal above sand pack composed of a 0.6-cm hydraulic hole plug
- Protective flush mount well casings secured with concrete

Monitoring well installation details are provided in the borehole logs in Appendix C. Monitoring wells onsite were tagged as a Well Cluster. The Well Tag number is pending from Aardvark.

Dedicated Waterra polyethylene tubing with an inertial lift foot valve was installed in each newly installed monitoring well. Wells were developed using this equipment to remove particulates or fluids that may have collected in the screen or sand pack during well installation activities. Well development was considered complete in the field under one of the following conditions:

- Removal of three complete well volumes, including sand pack
- The monitoring well was developed dry three times
- Groundwater was clear and relatively free of particulates

All monitoring wells for each sampling event were examined for nonaqueous phase liquid (NAPL) using an interface probe. The presence or absence of NAPL was recorded in the monitoring well development field form. The monitoring well was then developed in accordance with the SOPs. Once the monitoring well had recovered to static conditions, the monitoring well was examined for NAPL using an interface probe.

5.6 Groundwater: Field Measurement of Water Quality Parameters

The field measurement of water quality parameters was performed during well purging and before the collection of groundwater samples. These measurements were required to provide an indication that the samples collected

were stable and representative of the groundwater in the formation, and to evaluate groundwater quality at the time of sampling.

This task was performed per the SOP. Water quality parameters were measured using the Horiba U-52 water quality meter. This instrument measures: groundwater temperature, pH, oxidation reduction potential, dissolved oxygen (DO), electrical conductivity (EC), and turbidity. Before taking the field measurements, the water quality meters used were calibrated according to the manufacturer's instructions using standard calibration solutions. Water quality meters were calibrated prior to use each day.

Water quality meter readings were collected approximately every 3 to 5 minutes and recorded in the field book and in groundwater sampling field tracking sheets for the following parameters: groundwater temperature, pH, oxidation reduction potential, DO, EC, and turbidity. These field parameters provided an indication of stabilized groundwater conditions before sampling occurred. Indicator parameters were deemed to be stable when an average of three consecutive measurements met the following criteria:

- $pH = \pm 0.1 \text{ unit}$
- Temperature = ±10 percent
- DO = ±10 percent or ±0.1 milligrams per litre (mg/L) if reading is less than 1 mg/L
- EC = ±10 percent
- Oxidation reduction potential = ±10 millivolts

Once stabilization had been reached, samples were collected in the appropriate sample containers for laboratory analysis.

5.7 Groundwater: Sampling

A decontaminated 30-m interface probe was used to measure the depth of groundwater and presence or absence of NAPL below the top of the monitoring well casing or other reference point. To prevent cross-contamination between monitoring wells, the interface probe was decontaminated per the SOP.

Before sampling, the monitoring wells were purged using a low-flow method so representative samples of the water-bearing formation were obtained. Purging was generally conducted using a peristaltic pump and dedicated polyethylene tubing at each well.

The field measurement of water quality parameters was performed routinely throughout the purging process and immediately before the collection of groundwater samples (Section 5.6).

Groundwater samples were collected immediately following the completion of purging and the stabilization of the groundwater parameters, via Waterra inertial foot valves or peristaltic pump and dedicated polyethylene tubing.

New laboratory-supplied containers were used to collect groundwater samples for the parameters of interest. Sampling glassware was prepared by the laboratory with the required preservatives added to the parameter-specific sample bottles. When filling the sample bottles, field staff verified that a minimal level of particulate matter was entrained into the sample. Samples with more than 1-cm of particulate in the sample bottle (after it had settled) were considered unsuitable for chemical analysis and were discarded; groundwater samples were recollected in new laboratory-supplied bottles, confirming that less than 1 cm of particulate was in the sample bottle prior to analysis.

Field filtering was conducted for certain parameters consistent with the SOPs. Field filtering of dissolved metals was conducted using dedicated 0.45 micrometre (μ m) filters. PAH groundwater samples were not field-filtered; however, benzo(a)pyrene analysis samples may be filtered by the laboratory (in compliance with MECP [2011c]).

Field-filtering of samples was documented in the groundwater sampling forms. VOC and PHC F1 sample containers were completely filled, with no headspace.

Section 6.7 describes groundwater quality based on the analytical results.

5.8 Sediment: Sampling

The Phase Two Property does not contain a water body as defined under O. Reg. 153/04; therefore, sediment was not present in the investigation area, and no sampling was conducted.

5.9 Analytical Testing

ALS Canada Limited (ALS), a laboratory accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA), provided the offsite laboratory analyses. ALS, and subcontractor labs overseen by ALS, performed the chemical analysis in compliance with the MECP document titled *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act* (MECP 2011c).

5.10 Residue Management Procedures

Excess soil cuttings generated from the field activities were contained in 200-litre (L) drums, and fluids generated during equipment decontamination, monitoring well development, and groundwater sampling were contained in either 1,000 L totes or 200 L drums, all of which were temporarily stored on the Phase Two Property. A composite soil sample was collected from the soil cuttings generated and submitted for Toxicity Characteristic Leaching Procedure analysis for environmental waste characterization and future waste management purposes. Wastes were managed per the requirements of O. Reg. 347 (MECP 1990c).

Sample results were compared to O. Reg. 347, Schedule 4 (MECP 1990c), which indicated t the investigation-derived waste would be classified as nonhazardous.

Jacobs coordinated the removal of soil and groundwater drums from the Phase Two Property as follows:

- On September 16, 2019, 32 drums of soil and one drum of water were removed from the Phase Two Property, and seven 1,000-L totes were pumped out by Aevitas Inc.
- On February 21, 2020, 21 drums of soil and 1,000 L of water were removed from the Phase Two Property by Aevitas Inc.
- On July 24, 2020, two drums of soil and one drum of water were removed from the Phase Two Property by Aevitas Inc. Appendix D provides the waste management documentation.

5.11 Elevation Surveying

Jacobs contracted West & Ruuska, a licensed Ontario Land Surveyor, of Brantford, Ontario, to perform an elevation survey to a geodetic benchmark following the completion of the subsurface investigations. The survey was performed on September 18, 2019. The survey referencing benchmark number and associated elevation is pending from West & Ruuska.

The elevation survey included the coordinates and elevations of the ground surface and top-of-riser pipe (as applicable) for the monitoring well and borehole locations advanced as part of Jacobs' investigation.

5.12 Quality Assurance and Quality Control Measures

The following sample handling, equipment cleaning, and field QC measures were followed during the Phase Two ESA investigation:

- Soil samples were collected in sample containers provided by the analytical laboratory, which were pre-charged with the appropriate preservatives and sized relevant to the analyses requested.
- Sample container labels included the project No., sample identification (ID), and parameters for chemical analysis. Unique sample IDs were assigned to correspond with the field notes or field forms associated with each sampling location.
- Once labelled, sample containers were placed in ice-filled coolers.
- Samples were transported to an offsite analytical laboratory; a chain-of-custody form was completed and accompanied each sample shipment.
- Deviations from the SAPs were noted and discussed with the QPESA, as applicable. Section 4.4 discusses SAP deviations.
- Equipment decontamination procedures were carried out per Jacobs' SOPs, which were developed in accordance with O. Reg. 153/04, and include (as applicable):
 - Cleaning tools for sample collection by removing particulate matter with a brush (as needed), rinsing with potable water, rinsing with methanol, rinsing with potable water, and drying with clean paper towel
 - Cleaning heavy equipment by removing particulate matter with a brush, pressure washing, or both, as required
- The SAPs included a QA/QC program that specified the following minimum field QC measures:
 - One laboratory-prepared trip blank was included in each cooler shipment containing volatile organics (for example, VOCs, BTEX, or PHC F1) samples.
 - Duplicate soil samples were collected and submitted at a minimum frequency of one duplicate for each 10 samples submitted. Duplicate samples were submitted 'blind' to the laboratory, and field staff documented in their field books each duplicate sample location.
 - Calibration checks on field instruments were completed daily and reported in the field book or SOP calibration forms.
 - Deviations from the QA/QC program were noted and discussed with the QPESA, as applicable.
 Section 4.4 discusses SAP deviations.

6. Review and Evaluation

6.1 Geology

The drilling program completed during the field investigations included advancing 27 boreholes to a maximum depth of 15.62 mbgs, which provided information about the subsurface materials. Jacobs created three geological cross-sections to show the Site stratigraphy. Figure 6-1 shows the locations of the cross-sections, and Figures 6-1a to 6-1d show the geological cross-sections A-A,' B-B,' C-C,' and D-D,' respectively.

The Site-specific geology generally consisted of the following characteristics:

- A thin layer of asphalt overlies the Site (up to 0.15 mbgs).
- Fill materials were observed from beneath the asphalt to a maximum depth of 3.91 mbgs, with an average thickness of 1.87 m. The fill is variable in composition; however, the majority of fill is sand, sand and gravel, or silty sand. Silty clay and clayey silt were also observed. Anthropogenic materials, such as brick, glass, metal products, and wood were commonly reported, as was iron oxide staining on the soil.
- Native overburden underlying the fill consists of a sand matrix that exists roughly from the bottom of fill to the bedrock, with interbedded layers of gravel and silt; generally, sand directly underlies the fill layer, and gravel and silt layers are found underlying some sand (the gravel and silt are described below). The sand is generally brown, dense, and moist; in the northern portion of the Site, the sand tends to have some silt content (ranging from trace silt to silty sand), and in the southern portion of the Site, the sand generally shows trace gravel. These differences are likely associated with the silt and gravel layers.
- A silt layer was encountered in the northern portion of the Site. The depth to silt ranged from 2.13 to 3.94 mbgs, and the average thickness of the layer was 3.58 m. The silt was generally described as brown or grey, fine to coarse sand, low to high plasticity, with traces of gravel. At two locations (BH201 and BH202), a high sand content was reported for part of the silt layer. In most locations where the silt was encountered, it underlies a layer of sand and directly overlies bedrock. The silt is considered an aquitard due to its low hydraulic conductivity (Section 6.3).
- A second, small silt lens was observed in the southern portion of the Site, characterized by BH203 and BH204. This lens is apparently disconnected from the larger silt layer in the northern portion of the Site. Depth to this silt layer ranged from 2.21 to 3.72 mbgs, with an average thickness of 1.37 m. This silt lens contacts bedrock at one location, and in the other terminates above a sand layer. The silt in this lens was described as brown, hard, and moist, with dolostone bedrock fragments observed.
- A layer of gravel and sand was encountered in the southern portion of the Site. The depth to this gravel and sand layer ranged from 1.52 to 5.94 mbgs, and the average thickness of the layer was 2.16 m. Generally, the sand and gravel extends to the bedrock, but in the southeastern portion of the Site, it terminates above a layer of sand. The material was generally described as brown and dense, with fine to medium sand, trace clay, and occasional cobbles and dolostone fragments. The gravel and sand layer is depicted in cross-sections A-A,' B-B,' and C-C' (Figures 6-1a through 6-1c).
- A clay lens was encountered in the middle of the Site (MW109). The clay was encountered from 1.14 to 2.44 mbgs, which is generally consistent with the depth of the fill layer, and is expected to be very small laterally. As some other fill materials were described as being clayey, it is possible this is layer is also anthropogenic.
- Bedrock at the Site is Guelph Formation dolostone. Depth to the overburden/bedrock contact ranged from 4.57 to 8.43 mbgs, with an average depth at 5.99 mbgs. The highest bedrock elevations were encountered along an approximate southwest-to-northeast transect of the Site (MW107, MW100, BH202, MW109, BH206; see Figure 6-1 for plan of borehole locations). Bedrock is described as being generally highly

weathered and fractured within the first 0.3-0.7 m of bedrock. It was also noted to be vuggy, with calcite mineralization.

A detailed description of geology encountered during the drilling program is included in the borehole logs provided in Appendix C.

6.2 Groundwater: Elevations and Flow Direction

The Phase Two Property is interpreted to consist of a predominantly sandy overburden overlying Guelph Formation dolostone bedrock. Within the northern portion of the Site, there is a thick silt deposit. There are two main hydrogeological units encountered at the Site: (1) perched groundwater above a silt strata in the northern portion of the Site, and (2) a shallow unconfined aquifer generally in the upper bedrock, but extending in places up into the overburden soil. These two hydrogeological units are referred to as 'the perched groundwater' and 'the bedrock aquifer,' respectively. The Site has been paved as a parking lot and is likely to receive low groundwater recharge from precipitation.

Groundwater conditions and characteristics were assessed using 18 monitoring wells (15 wells installed as part of the field investigation for the Phase Two Property, and three existing historical monitoring wells):

- Three of these wells (BH17-MW5S, MW102A and MW103) are screened entirely within the overburden in the northern portion of the Site and were used to evaluate the perched groundwater.
- Twelve wells are screened within the upper bedrock to delineate the water table, two of which (MW104 and MW105) straddle the overburden and bedrock contact.
- Three wells (MW107B, MW110B, and MW111) are installed in the deeper in the bedrock aquifer.

Table 6-1 provides the construction details for the newly installed and historical groundwater monitoring wells.

Groundwater elevations were measured in various wells during the Phase Two investigation as follows:

- 1) September 11, 2019: All 11 wells were monitored for groundwater elevation. Depth to groundwater in the bedrock aquifer wells ranged from 6.45 to 8.48 mbgs (321.19 to 322.72 masl). Depth to the perched groundwater in the overburden wells ranged from 4.11 to 4.31 mbgs (325.19 to 325.41 masl).
- 2) September 18, 2019. All 11 wells were monitored for groundwater elevation. Depth to groundwater in the bedrock aquifer wells ranged from 6.48 to 8.56 mbgs (321.14 to 322.69 masl). Depth to the perched groundwater in the overburden wells ranged from 4.14 to 4.48 mbgs (325.12 to 325.38 masl).
- 3) December 18, 2019. All 15 wells and one historical well were monitored for groundwater elevation. Depth to groundwater in the bedrock aquifer wells ranged from 6.46 to 8.66 mbgs. Depth to the perched groundwater in the overburden wells ranged from 4.0 to 4.45 mbgs.
- 4) April 15, 2020. All 15 wells and one historical well were monitored for groundwater elevation. Depth to groundwater in the bedrock aquifer wells ranged from 6.27 to 8.33 mbgs. Depth to the perched groundwater in the overburden wells ranged from 3.78 to 3.92 mbgs.

Table 6-2 presents a record of the available groundwater elevations. Figures 6-2a, 6-2b, and 6-2c present the September 2019, December 2019, and April 2020, interpreted groundwater elevation contours and flow directions within the bedrock aquifer for the Phase Two Property, respectively.

The bedrock aquifer water table elevation was observed to vary by 1.77 m in elevation across the Site. Local groundwater is expected to flow east, toward the Speed River; however, Site specific groundwater flow was interpreted to be radial, from a high elevation on the west boundary of the Site towards the north, and east to

southeast. The higher groundwater elevations at the western portion of the Site appear to be correlated with higher bedrock elevation.

The perched groundwater was observed at BH17-MW-5S, MW102A, and MW103 above a low-permeability silt aquitard layer. The full extent of the perched groundwater is currently not fully understood but may have a similar extent to the silt layer.

The bedrock was observed to have a variable hydraulic conductivity and water-bearing capacity during Site investigations (refer to Section 6.3.1).

The minimum depth to groundwater observed at the Site was 3.78 mbgs (perched) and 5.82 (bedrock). Underground utilities are not expected to extend to that depth (refer to Figure 2-2b; depths of utilities are unknown), and therefore not expected to significantly influence the groundwater flow directions.

6.3 Groundwater: Hydraulic Gradients

6.3.1 Horizontal and Vertical Gradients

Jacobs estimated the hydraulic conductivity (K) of the low-permeable silt layer and bedrock units based on slug testing in five wells (MW102A and MW103 for the silt; MW101, MW107 and MW109 for the bedrock). Table 6-3 presents the hydraulic conductivity values collected on Site. The K for the silt layer ranged from 3.6×10^{-8} to 7.4×10^{-7} metres per second (m/s), with a geometric mean of 1.6×10^{-7} m/s. The K for the bedrock unit ranged from 4.6×10^{-7} to 2.0×10^{-4} m/s, with a geometric mean of 6.0×10^{-6} m/s.

The horizontal hydraulic gradient within the bedrock aquifer was estimated for the September 18, 2019, December 18, 2019, and April 15, 2020 monitoring events. The horizontal hydraulic gradient within the bedrock aquifer was similar in September and December 2019, with estimated average gradients of 0.018 metres per metre (m/m) and 0.017 m/m, respectively. The range of hydraulic gradients for these two events were between 0.016 m/m and 0.025 m/m.

The horizontal hydraulic gradients for April 2020 were lower across the Site, estimated between 0.009 m/m and 0.015 m/m, and had an average gradient of 0.013 m/m. The maximum groundwater elevations within the bedrock aquifer were measured during this monitoring event, likely associated with increased precipitation and runoff in the spring. Elevated groundwater levels may have "flattened" the gradient compared to fall and winter. Horizontal hydraulic gradient calculations are presented in Appendix E, Table E-1a.

The horizontal linear groundwater flow velocity was estimated for the bedrock aquifer using the calculated geomean K value of 6.0×10^{-6} m/s, the estimated horizontal hydraulic gradient range of 0.009 to 0.025 m/m, and an estimated porosity of 0.1 representing bedrock. The horizontal groundwater velocity within the bedrock aquifer was estimated between 24 and 47 metres per year (m/y). Calculations are presented in Appendix E, Table E-2.

Vertical gradients were calculated at three nested monitoring well sets using the September 18, 2019, December 18, 2019, and April 15, 2020 groundwater snapshots. All calculated vertical gradients were downward. The vertical hydraulic gradients observed at two nested well pairs (MW107/MW107B, and MW110A/MW110B) ranged between 0.042 and 0.063 m/m. Stronger vertical gradients were observed at MW102A and MW102B, ranging between 0.621 and 0.634 m/m, likely due to the influence of the perched groundwater above the silt layer observed at this well nest. Calculations are presented in Appendix E, Table E1-b.

6.4 Fine-to-medium Soil Texture

Under O. Reg. 153/04, "coarse textured soil" contains more than 50 percent by mass of particles that are 75 μ m or larger in mean diameter (MECP 2011a). According to the regulation, if one-third of the soils at the Phase Two Property are coarse-grained, the more-stringent coarse-textured soil standards apply to the Site; otherwise, the medium-/fine-grained soil standards may apply.

Grain-size analysis was performed on twenty soil samples. Of these, 11 samples were classified as coarse-grained and 9 samples were classified as fine- to medium-grained. Grain size curves for the selected samples are provided at the end of Appendix F. The soil condition standards for coarse-grained soils were used at Phase Two Property, to account for the extensive presence of heterogeneous fill materials across the surface of the Site.

6.5 Soil: Field Screening

Field screening techniques were used during the Phase Two ESA to identify soils impacted by VOCs. PID measurements were performed during the investigation using the procedures and equipment described in Section 5.4.

PID results from the current investigation (by soil unit) are summarized as follows:

- Fill: PID readings from the fill material onsite were generally less than 10 ppm, except for BH204 and BH205. The maximum PID reading from this unit was measured at BH205 (40.2 ppm).
- Sand: PID readings from this unit were generally less then 10 ppm with some greater values detected. The maximum PID reading from this unit was measured at BH200 (75.3 ppm).
- Silt: The PID readings from this unit (located in the northern portion of the Site) were generally less than 10 ppm. The maximum PID reading from this unit was measured at BH201 (9.9 ppm).
- Sand and Gravel: The PID readings from this unit (in the southern portion of the Site) were generally less than 10 ppm, with some greater values detected. The maximum PID reading from this unit was measured at BH205 (64.5 ppm).

Visual and olfactory observations and soil vapour headspace measurements (in ppm) were recorded in the borehole logs provided in Appendix C.

6.6 Soil Quality

Through current and historical investigations, the nature and extent of potential soil contamination were investigated for each identified APEC and for the Phase Two Property in its entirety. Figure 4-2 shows the APECs and associated sample locations. Investigative locations, including the analysis completed at each location, are summarized on an APEC-by-APEC basis in Table 6-4. Figure 6-3 presents historical data that were considered unreliable for RSC purposes, but used to direct the Phase Two ESA investigations. Table 6-5 provides the analytical results of the Phase Two ESA investigation, along with sampling depth, and compares these to the Table 2 SCS (MECP 2011b). Figures 6-4 through 6-12 present the distribution of soil concentrations exceeding the Table 2 SCS by analytical group in plan view for all stratigraphic units.

The inferred horizontal extent of soil concentrations greater than the Table 2 SCS are also shown. Where there are exceedances of the applicable SCS (except for parameters relying on an exemption [Section 6.10.7.7]), Jacobs has prepared at least one cross-section by analytical group, which follows the plan view figure. The cross-sections present the inferred vertical extent of soil concentrations greater than the Table 2 SCS. Maximum concentrations of each detected parameter are provided in Table 6-6 and shown in red text on the respective plan view and cross-sectional figures.

Soil quality across the Site was evaluated using a total of 95 soil samples collected from various depths from 36 sampling locations across the Site. Samples were submitted for laboratory analysis for one or more of the following analytes:

- Other regulated parameters (ORPs) (hot-water-soluble boron [HWS boron], hexavalent chromium, cyanide, mercury, EC, and sodium adsorption ratio [SAR])
- Metals and hydride-forming metals
- BTEX
- PHCs
- PAHs
- VOCs
- Acid, Base, Neutral Compounds (ABNs)
- PCBs
- Dioxins and furans (D&Fs)

Soil at the Phase Two Property was found to be generally impacted with ORPs; specifically, salt-related analytes (that is, EC and SAR). Localized impacts of metals, specifically lead and mercury, were also identified. The following subsections provide details about the frequency, distribution, and identification of COCs.

6.6.1 Other Regulated Parameters (Electrical Conductivity, Sodium Adsorption Ratio, Hot-water-soluble Boron, and Cyanide)

SAR and EC exceedances in soil were widespread across the Site, with 56 of 64 samples (88 percent) from 15 of 17 locations (88 percent) exceeding the Table 2 SCS. Exceedances of EC and SAR were identified to a maximum depth of 7.92 mbgs (MW102B) and were present at depths extending from the ground surface to the bedrock surface. Maximum concentrations were identified at MW102B (2.95 milliSiemens per centimetre [mS/cm]) and MW113 (108) for EC and SAR, respectively. At MW102B, EC concentrations decreased with depth, but were still above the Table 2 SCS in the sample collected just above the bedrock surface. At MW113, the maximum concentrations of SAR were found at 1.98 to 2.59 mbgs. SAR and EC exceedances were present across all areas of the parking lot, except for the northeastern portions of the 152 and 160 Wyndham Street North parcels. The presence of EC and SAR are likely a result of the application of deicing materials (that is, road salts) on the parking lot surfaces (APEC-4). At the discretion of the QPESA and based on the revised regulation, these parameters are not considered to be COCs at the Phase Two Property.

Correlated ORP parameters in groundwater, sodium and chloride, were also identified at the Phase Two Property, indicating that these parameters in soil are likely acting as a contaminant source contributing to groundwater.

Cyanide and HWS-boron were analyzed in 48 samples collected from 17 locations at the Site, with no exceedances of the Table 2 SCS.

Figure 6-4 presents (in plan view) the locations and sample depths for the ORP soil samples at the Phase Two Property, showing the horizontal extent of impacts.

6.6.2 Metals, Hydride-forming Metals, and Select ORPs (Mercury, Methylmercury, and Hexavalent Chromium)

Metals, hydride-forming metals, and select ORPs were assessed across the Site using data from the current investigation, supplemented with data from 2008 (XCG 2008). Metals data from 1993 and 2001, not considered

reliable for the Phase Two ESA (samples were not collected or analyzed using O. Reg. 153/04 protocols, or may not represent current condition; refer to Section 3.2), were used as screening data to plan the Phase Two ESA investigation.

Historical metals exceedances (for cadmium, copper, lead, and zinc) were identified from data collected in 1993 and 2001, reported in the central portion of the Site at BH-K3, SA9, and BH-K2 see Figure 6-3) within the surficial fill. One sample from BH-06, collected in 2008, exceeded the Table 2 SCS for lead with a concentration of 199 μ g/g at 3.1 to 3.7 mbgs.

Jacobs collected an additional 20 samples for metals during the current investigation to expand on the distribution of metals at the Site, and included reanalysis at select historical locations where the historical exceedances were identified (Figure 6-3). A total of 69 samples from 33 locations were analyzed for metals at the Phase Two Property. Samples met the Table 2 SCS across the Site, except for one location: elevated concentrations of lead and mercury were identified in a sample collected from MW101 (0.46 to 0.61 mbgs), located in the existing laneway in the southeastern portion of the Site. Based on observations during the drilling and test-pitting activities, the exceedances were estimated to be localized to the poor-quality fill in this area. Exceedances extended to a maximum depth of 3.0 mbgs, based on a deeper sample meeting the Table 2 SCS. Maximum concentrations of lead and mercury of 207 and 0.889 μ g/g, respectively were reported at MW101. The poor quality fill was not observed at other locations within the Phase Two Property.

The exceedance at BH-06 was reinvestigated by collecting a sample during the current investigation (BH211), from within 2 m of the original location at the same depth of the previous exceedance. A concentration of 18.7 μ g/g was reported, and therefore the soil at this location was determined to meet the Table 2 SCS, with an averaged concentration of 109 μ g/g.

Metals exceedances were determined to be isolated to the fill materials in the southeastern portion of the Site. All samples collected from native materials met the Table 2 SCS. Metals impacts are potentially related to historical industrial activities associated with the manufacture of sewing machine accessories and wire coils/springs (APEC-1) or general impacts associated with the fill identified on Site (APEC-2).

Apart from cadmium, metal exceedances of Table 2 SCS were not identified in groundwater, indicating that the metal impacts in soil (that is, lead and mercury) are not currently acting as a contaminant source contributing to impacts in groundwater.

Figure 6-5 presents (in plan view) the locations and sample depths for the soil samples collected for metals, hydride-forming metals, and select ORPs at the Phase Two Property, showing the horizontal extent of impacts. Figures 6-5a and 6-5b present the cross-sections, showing the vertical extent of metals impacts on the Phase Two Property.

6.6.3 Benzene, Toluene, Ethylbenzene, and Xylenes

BTEX was analyzed in soil in 53 samples from 20 locations, with no exceedances of the Table 2 SCS identified. BTEX were COPCs associated with various APECS across the Site associated with onsite PCAs, including APEC-3 (Historical Transformers), APEC-18 (Former Oil Shed), APEC-19 (Former Oil House), and APEC-21 (Former Garage).

Figure 6-6 presents (in plan view) the locations and sample depths for the BTEX soil samples collected at the Phase Two Property.

6.6.4 Petroleum Hydrocarbons

PHCs were analyzed in soil in 61 samples from 27 locations, with no exceedances of the Table 2 SCS identified from the current investigation. Historical PHC exceedances were identified in a surficial sample collected from BH-10 (0.0 to 0.6 mbgs) in 2008, which exceeded the Table 2 SCS for PHC F3 and F4 (Figure 6-3). Concentrations exceeded the free phase threshold for PHC F4 (MECP 2011d) however, no odours or staining were noted in the borehole log for this historical location. A borehole (BH207) was installed at this location during the current investigation, and no petroleum odours or staining were noted during the drilling activities. Samples from this location reported concentrations less than the Table 2 SCS, confirming the absence of PHCs where historical exceedances were identified. Based on the available information, the historical exceedance is likely related to the potential presence of asphalt in the soil sample and not representative of the current conditions on the Site; therefore, the PHC results were considered to be unreliable and were removed from the Phase Two ESA dataset.

PHCs as COPCs were associated with various APECs across the Site associated with onsite and offsite PCAs, including APEC-2 (Unknown Fill Quality), APEC-3 (Historical Transformers), APEC-14 (Historical Gasoline Spill), APEC-18 (Former Oil Shed), APEC-19 (Former Oil House), and APEC-21 (Former Garage).

Figure 6-7 presents (in plan view) the locations and sample depths for the PHC soil samples collected at the Phase Two Property.

6.6.5 Polycyclic Aromatic Hydrocarbons

PAHs were analyzed in 55 samples from 22 locations, with no exceedances of the Table 2 SCS from the current investigation. One historical sample from 2008, located in the west-central portion of the Site, exceeded the Table 2 SCS for dibenzo(a,h)anthracene (BH-14) with a concentration of 0.13 μ g/g, from a depth of 0.8 to 1.4 mbgs. This exceedance was reinvestigated during the current investigation (BH208), from within 2 m of the original location. A concentration of 0.05 μ g/g was reported from a depth of 0.91 to 1.07 mbgs; therefore, soils in this location were determined to meet the Table 2 SCS, with an averaged concentration of 0.09 μ g/g. It is the QPESA's opinion that the exceedance was most likely related to the asphalt at the surface of the sampling location and is not been considered representative of current site conditions.

PAHs were COPCs associated with various APECs onsite, including APEC-2 (Unknown Fill Quality), APEC-3 (Historical Transformers), APEC-14 (Historical Gasoline Spill), APEC-18 (Former Oil Shed), APEC-19 (Former Oil House), APEC-20 (Former Coke Storage), and APEC-21 (Former Garage).

Figure 6-8 presents (in plan view) the locations and sample depths for the PAH soil samples collected at the Phase Two Property.

6.6.6 Volatile Organic Compounds

VOCs (excluding BTEX) in soil were investigated at the Site via 53 samples from 20 locations, with no exceedances of the Table 2 SCS identified. VOCs were COPCs associated with various APECS across the Site, including APEC-1 (Former Industrial Property Use), APEC-2 (Unknown Fill Quality), APEC-3, APEC-14 (Historical Gasoline Spill), APEC-18 (Former Oil Shed), APEC-19 (Former Oil House), APEC-20 (Former Coke Storage), and APEC-21 (Former Garage).

Figure 6-9 presents (in plan view) the locations and sample depths for the VOC soil samples collected at the Phase Two Property.

6.6.7 Acid, Base, Neutral Compounds

ABN compounds at the Site were investigated via four samples from one location, with no exceedances of the Table 2 SCS identified. ABNs were COPCs associated with APEC-20 (Former Coke Storage).

Figure 6-10 presents (in plan view) the locations and sample depths for the ABN soil samples collected at the Phase Two Property.

6.6.8 Polychlorinated Biphenyls

PCBs in soil were investigated via nine samples from five locations, with no exceedances of the Table 2 SCS identified. One historical sample along the eastern property boundary (SA9) exceeded the Table 2 SCS from 0.0 to 0.15 mbgs (XCG 1993). As Section 3.2 discussed, these data were excluded for use in the Phase Two ESA, but were used to direct the current investigation. PCBs were resampled (BH209) at this historical location at two separate intervals between ground surface and 1 mbgs, and all results were reported as nondetect concentrations of $0.02 \mu g/g$.

Kewen (2001) indicated the transformer area (APEC-3) may have been previously remediated. Although additional documentation has not been provided to Jacobs, based on the recent soil samples collected in the vicinity of SA9, PCB exceedances were not identified at the Site.

Figure 6-11 presents (in plan view) the locations and sample depths for PCB soil samples collected at the Phase Two Property.

6.6.9 Dioxins and Furans

D&Fs in soil at the Site were investigated via two samples collected from two locations at the Site, with no exceedances of the Table 2 SCS. D&Fs were potentially associated with 152 and 160 Wyndham Street North, where a historical fire was reported to have occurred; however, no impacts were identified onsite during the Phase Two investigation.

Figure 6-12 presents (in plan view) the locations and sampling depths for the dioxins and furans soil samples collected at the Phase Two Property.

6.6.10 Contaminants of Concern in Soil

O. Reg. 153/04 (MECP 2011a) defines COCs as chemicals with concentrations that exceed the applicable SCS or chemicals with no applicable SCS that are associated with a PCA. The MECP document entitled *Procedures for Use of Risk Assessment under Part XV.1 of the Environmental Protection Act* (Procedures Document) (MECP 2005) indicates at the discretion of the QPESA, chemicals without an applicable SCS may be included or excluded as COCs based on an understanding of geoscience, the potential for the chemical to limit the use of the Site, or both.

Maximum concentrations (Table 6-6) of each chemical analyzed in soil at the Phase Two Property were screened against the Table 2 SCS (Table 6-7a). In general, where concentrations were found detected greater than the Table 2 SCS, the parameters were retained as a COC to be evaluated in the RA.

Additional review was conducted for parameters, specifically sodium, which has no Table 2 SCS, but has an available Ontario Typical Range value, and was found at elevated concentrations. SAR assesses the risks of sodium in soil; therefore, at the discretion of the QPESA, sodium was not specifically assessed or carried forward as a COC. The rational for the removal of sodium in soil is presented in Table 6-7b. Parameters that were not

considered as COCs based on averaging from additional sampling or exceptions in Section 49.1 of O. Reg. 153/04 are presented in Table 6-10c.

All analytes with a Table 2 SCS that were reported as nondetect had laboratory reporting limits (RLs) less than the SCS. No analytes associated with a PCA and without a MECP SCS were reported as detected in onsite soils.

Table 6-7d summarizes the chemicals retained as COCs in soil for the Phase Two Property based on the evaluation provided.

6.7 Groundwater Quality

The nature and extent of potential groundwater contamination was investigated for the identified APECs. Figure 4-2 shows the APECs and associated sample locations. Table 6-8 summarizes the analytical results of the investigation, along with the well screen interval, and compares these to the applicable Table 2 SCS (MECP 2011b). Figures 6-13 through 6-19 present the groundwater concentrations exceeding the applicable Table 2 SCS by analytical group in plan view for all groundwater units. For this report, cross-sections showing the inferred vertical extent of groundwater concentrations greater than the Table 2 SCS have been produced for the metals analytical group only (cadmium).

Groundwater across the Site was evaluated using a total of 39 groundwater samples collected from 15 groundwater monitoring wells. Samples were submitted for laboratory analysis for one or more of the following analytes:

- ORPs (chloride, cyanide, and sodium)
- Metals (field filtered)
- BTEX
- PHCs
- PAHs
- VOCs
- ABNs

Groundwater impacts at the Phase Two Property associated with sodium and chloride were widespread across the Site. Cadmium exceedances were noted in two monitoring wells along the western property boundary. Sample results were compared to the MECP Table 2 SCS.

6.7.1 Other Regulated Parameters (Chloride, Sodium, and Cyanide)

Chloride and sodium exceedances in groundwater were widespread across the Site, with 24 of 32 samples (75 percent) from 13 of 15 locations (87 percent) exceeding the Table 2 SCS. Maximum concentrations of chloride and sodium were identified at the northern end of the Site in MW102B, with reported values of 9,610,000 micrograms per litre (μ g/L) and 6,100,000 μ g/L, respectively. Based on the soil results for EC and SAR in soil, these soil impacts are likely acting as a source of contaminant mass contributing to the groundwater at the Phase Two Property. Chloride and sodium are associated with APEC-4 (Use of Road Salts). Changes to 0. Reg. 153/04 include exceptions for exceedances of the SCS for salt-related substances; specifically, Section 49.1 states the SCS is deemed not to be exceeded for the purpose of Part XV.1 of the Act when a substance that has been applied to surfaces for the safety or vehicular or pedestrian traffic under conditions of snow or ice or both exceeds the SCS. Refer to Table 6-10c and Section 6.10.9 (Reliance on Exemption on SCS Exceedances) for additional details and rationale.

Cyanide was analyzed in 25 samples collected from 11 locations at the Site, with no detected exceedances of the Table 2 SCS. Cyanide was not identified at concentrations greater than the Table 2 SCS in soil; therefore, there is no source in soil to act as a source contaminant mass to the groundwater at the Phase Two Property.

Figure 6-13 presents (in plan view) the locations and screen depths for the ORP groundwater samples collected at the Phase Two Property.

6.7.2 Metals, Hydride-forming Metals, and Select ORPs (Mercury and Hexavalent Chromium)

Metals parameters, including hydride-forming metals, mercury, and hexavalent chromium, were analyzed in groundwater at the Site. The detected concentrations met the Table 2 SCS, apart from cadmium, with 7 of 36 samples (19 percent) from 2 of 15 locations (13 percent) exceeding the Table 2 SCS.

Cadmium exceedances in groundwater were found at MW107 and MW113, both screened from 5.3 to 8.4 mbgs and located along the southwestern property boundary. The maximum concentration was reported at MW113, which has been vertically delineated by MW107B (13.5 to 15.4 mbgs), with concentrations less than the Table 2 SCS. Wells located downgradient towards the east (MW110A, MW110B and MW101) reported concentrations of cadmium less than the Table 2 SCS. Additionally, available data from MW106 (5.5 to 8.5 mbgs), which is located offsite on adjacent City-owned property to the south, had reported concentrations of cadmium five times less than the Table 2 SCS. This along, with reported concentrations less than the Table 2 SCS at MW101 and MW110A/B, indicates onsite exceedances in groundwater are not likely migrating offsite.

The RLs for nondetect concentrations were greater than the Table 2 SCS for one or more parameters (antimony, beryllium, cobalt, silver, and vanadium) in samples from four locations (MW100, MW102A, MW102B, and MW110A). The laboratory Certificate of Analysis (COA) indicates the following for each of these samples: "Detection Limit Raised: Dilution required due to high concentration of test analyte(s)." The RLs were likely elevated due to the elevated concentrations of sodium and chloride in the samples. These metals are, therefore, not considered COCs for the Site. Refer to Table 6-10b for additional details and rationale.

Metals as COPCs were associated with 15 of the 21 APECs across the Phase Two Property; however, limited impacts were identified in groundwater at the Site (cadmium), which do not correspond with the shallow metal impacts in soil (lead and mercury). Therefore, it is unlikely that metals impacts in soil are acting as a source of contaminant mass contributing to the groundwater quality at the Phase Two Property. Given the location of the onsite cadmium impacts and no cadmium exceedances found in soil at the Site, the elevated concentrations may be related to offsite and upgradient PCAs (to the west) (for example, APEC-11 for Industrial Operations, APEC-12 for Historical Automotive Garage) or other unknown sources.

Figure 6-14 presents the plan view for metals groundwater sample locations and screen depths at the Phase Two Property. Figures 6-14a through 6-14c present the cross-section views of the cadmium impacts in groundwater.

6.7.3 Benzene, Toluene, Ethylbenzene, and Xylenes

BTEX parameters in groundwater were analyzed using 27 samples collected from 11 locations at the Site, with no detected exceedances of the Table 2 SCS. BTEX was associated with 7 of the 21 APECs across the Phase Two Property; however, no impacts were identified in groundwater at the Site, and no areas of BTEX impacted soil were identified. Therefore, for BTEX, soil does not appear to be acting as a source of contaminant mass contributing to the groundwater quality at the Phase Two Property.

Figure 6-15 presents (in plan view) the locations and screen depths for the BTEX groundwater samples collected at the Phase Two Property.

6.7.4 Petroleum Hydrocarbons

PHCs in groundwater were analyzed using 25 samples collected from 11 locations at the Site with no detected exceedances of the Table 2 SCS. PHCs are associated with 16 of the 21 APECs across the Phase Two Property;

however, no impacts were identified in groundwater at the Site, and concentrations in soil were confirmed to not be present based on the current investigation. Therefore, for PHCs, soil does not appear to be acting as a source of contaminant mass contributing to the groundwater quality at the Phase Two Property.

Figure 6-16 presents (in plan view) the locations and screen depths for the PHC groundwater samples collected at the Phase Two Property.

6.7.5 Polycyclic Aromatic Hydrocarbons

PAHs in groundwater were analyzed using 25 samples collected from 11 locations at the Site, with no exceedances of the Table 2 SCS. PAHs as COPCs were associated with 16 of the 21 APECs across the Phase Two Property; however, no impacts were identified in groundwater at the Site, and PAHs in soil were determined not to be present based on the resampling of historical locations as part of the current investigation. Therefore, for PAHs, soil does not appear to be acting as a source of contaminant mass contributing to the groundwater quality at the Phase Two Property.

Figure 6-17 presents (in plan view) the locations and screen depths for the PAH groundwater samples collected at the Phase Two Property.

6.7.6 Volatile Organic Compounds

VOCs (excluding BTEX) in groundwater were investigated at the Site using 27 samples collected from 11 locations. The detected concentrations of VOCs met the Table 2 SCS, except chloroform. Concentrations of chloroform were greater than the Table 2 SCS in 12 samples from 5 locations; however, the chloroform exceedances are believed to be attributable to the introduction of municipal water during the subsurface drilling activities. Changes to O. Reg. 153/04 includes exemptions relating to contaminants related to municipally-treated water; specifically, Section 49.1 (2) states the SCS is deemed not to be exceeded for the purpose of Part XV.1 of the Act when the QPESA has determined, based on a Phase One ESA of Phase Two ESA, that there has been a discharge of drinking water. Chloroform is, therefore, not considered a COC for the Site. Refer to Table 6-10c and Section 6.10.9 (Reliance on Exemption on SCS Exceedances) for additional details and rationale. VOCs were associated with 18 of the 21 APECs across the Site; however, no impacts were identified in groundwater (or soil) at the Site. Therefore, for VOCs, soil does not appear to be acting as a source of contaminant mass contributing to the groundwater quality at the Phase Two Property.

Figure 6-18 presents (in plan view) the locations and screen depths for the VOC groundwater samples collected at the Phase Two Property.

6.7.7 Acid, Base, Neutral Compounds

ABNs in groundwater were analyzed in four samples from one location associated with APEC-20 (Former Coke Storage), with no exceedances of the Table 2 SCS. ABN impacts were not identified in soil at the Site, and therefore, could not act as a contaminant source mass for impacts in groundwater.

Figure 6-19 presents (in plan view) the locations and screen depths for the ABN groundwater samples collected at the Phase Two Property.

6.7.8 Polychlorinated Biphenyls

As PCBs in soil were confirmed to be absent within the one associated APEC (APEC-3: Historical Transformers), PCBs were not analyzed in groundwater. Therefore, for PCBs, soil does not appear to be acting as a source of contaminant mass contributing to the groundwater quality at the Phase Two Property.

6.7.9 Dioxins and Furans

D&Fs were not identified in soil at the Site, and therefore, could not act as a contaminant source mass for impacts in groundwater. D&Fs were not sampled in groundwater, considering the soil results and the physical/chemical properties of these compounds (that is, they tend to sorb to soils and are unlikely to be found in groundwater in the absence of a soil source).

6.7.10 Contaminants of Concern in Groundwater

O. Reg. 153/04 (MECP 2011a) defines COCs as chemicals with concentrations that exceed the applicable SCS or chemicals with no applicable SCS associated with a PCA. The MECP Procedures Document (MECP 2005) indicates that at the discretion of the QPESA, chemicals without an applicable SCS may be included or excluded as COCs based on an understanding of geoscience, the potential for the chemical to limit the use of the Site, or both.

Maximum concentrations (Table 6-9) of each chemical analyzed in groundwater at the Phase Two Property were screened against the Table 2 SCS (Table 6-10a). In general, where concentrations were found detected greater than the Table 2 SCS, the parameters were retained as a COC and evaluated in the RA.

An additional review was conducted for parameters that were reported as nondetect with laboratory RLs greater than the Table 2 SCS. At the discretion of the QPESA, some of these parameters were not carried forward as COCs if there was enough evidence to indicate the chemical was likely not present onsite at concentrations greater than the SCS, or would not interfere with the use of the Site, and should not be retained as a COC for carrying through to the RA. The rationale for the exclusion of these individual parameters in groundwater is presented in Table 6-10b. Parameters that were not considered as COCs based on the exceptions in Section 49.1 of O. Reg. 153/04 are presented in Table 6-10c.

Table 6-10c summarizes the chemicals retained as COCs in groundwater for the Phase Two Property based on the evaluation provided.

6.8 Sediment Quality

The Phase Two Property does not include a water body within its boundary as defined under O. Reg. 153/04. Therefore, sediment was not present in the investigation area.

6.9 Quality Assurance and Quality Control Results

As part of the field QA/QC program, the types of QA/QC samples collected included duplicate samples and trip blanks (for groundwater volatile analytes). Blind duplicate soil and groundwater samples were collected at a frequency of 1 duplicate sample for each 10 field samples submitted. Trip blanks for VOCs were submitted to the laboratory for chemical analysis with each VOC groundwater batch submittal. These QA/QC samples are important in determining whether field, transport, or analytical activities/conditions may have biased the reported soil and groundwater results (for example, cross-contamination). Accurate soil and groundwater results are required to appropriately evaluate the Phase Two Property for the applicable SCS.

Jacobs received soil and groundwater COAs from the laboratory electronically to reduce the possibility of transcription errors. Each sample collected by Jacobs as part of this Phase Two ESA investigation has an associated COA. Table F-1 in Appendix F provides a list that correlates each sample ID with a laboratory COA number. The COAs received from the analytical laboratory comply with the reporting requirements outlined in Section 47(3) of O. Reg. 153/04 and are provided in Appendix F.

For the current investigations, results were evaluated though a data quality evaluation (DQE) by the Jacobs project chemist. All samples were handled in accordance with the MECP *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act* related to the following considerations:

- Holding times
- Preservation method
- Storage requirement
- Container type

In combination with the field QA/QC program, the laboratory QA/QC program was evaluated to verify the accuracy, precision, and validity of the data reported by the laboratory. Various elements of the laboratory QA/QC program are used to evaluate the data:

- Blanks are analyzed to detect laboratory contaminations that can cause data to be biased high.
- Laboratory control samples (LCS) are used to evaluate the laboratory performance.
- Laboratory duplicates are used to measure precision in the laboratory.
- Matrix spikes (MS) are used to identify high or low bias caused by matrix interference.
- Surrogate spikes are used to evaluate the method performance that can cause high or low bias in the data.

The laboratory QA/QC program was evaluated by examining blanks, LCS, MS, and surrogate spike samples.

The precision of the data was verified through the review of the laboratory and field data quality indicators that include laboratory duplicate and field duplicate relative percent differences (RPDs). All field (FD) and laboratory duplicate RPDs calculated for the Baker Street samples were within the acceptable limits (below 30% for groundwater and 50% for soil) except the following:

- Three FD pairs due to RPD exceedances for three metal analytes; 6 results were qualified.
- One FD pair due to RPD exceedance for moisture; 2 results were qualified.

Detected results associated with the RPD exceedance were flagged "J" and are considered estimated.

The accuracy of the data was verified through the review of the LCS, MS and surrogate recoveries, as well as the evaluation of laboratory method blanks, trip blank data, and other method specific criteria. The overall accuracy reported in this DQE is considered acceptable but was affected by the following:

- Three PAH and five D&F sample results in a combined three samples from COAs L2318180, L2320007, and L2328062 were flagged due gas chromatography/mass spectrometry (GC/MS) qualifier ion ratio not meeting criteria
- Eleven D&F results were flagged due to concentrations less than the calibration range but greater than the EDL; the estimated maximum concentrations are reported
- Four SAR results were flagged due to nondetection for both calcium and magnesium; the lowest possible concentration is reported as a minimum value
- Nineteen SAR result were flagged due to nondetection for sodium or one of calcium or magnesium; the highest possible concentration is reported as a maximum
- Two sample results for n-hexane from COA L2336718 were flagged due to LCS recovery less than the lower control limit
- Four sample results for dichlorodifluoromethane were flagged due to LCS recovery less than the lower control limit; two samples each from COA L2320007 and COA L2436005
- Three F1 (C6-C10) result from COA L2333129 were flagged due to surrogate recoveries less than the lower control limit

 Two D&F sample results in sample MW108-5-6' from COA L2318180 were flagged due to associated laboratory blank contamination

Detected and nondetected results associated with these QC issues were flagged "J" and "UJ," respectively, and are considered estimated. There were also two sample results that were flagged "U" and are considered nondetected due to detections in the laboratory blank.

The representativeness of the data was verified through the samples' collection, storage, and preservation procedures and the verification of holding-time compliance. The samples shipped to the laboratory arrived below the recommended 10°C and were analyzed within the required holding time, except for a moisture result in sample BH203-0.5-2, which was analyzed beyond the recommended holding time. This result was flagged "J" and is considered estimated.

The comparability of the data was verified using standard analytical procedures and standard units for reporting. Results obtained are comparable to industry standards in that the collection and analytical techniques followed approved, documented procedures.

Completeness is a measure of the number of valid measurements obtained in relation to the total number of measurements planned. Valid data are defined as all data that are not rejected for project use. No data have been rejected. All data are considered valid.

The soil and groundwater analytical data evaluated as part of the DQE are considered valid and can be used to support the project decision-making process.

6.10 Phase Two Conceptual Site Model

Based on recent and historical Phase Two ESA work completed at the Phase Two Property, this section provides a Phase Two conceptual site model, as required by O. Reg. 153/04 (MECP 2011a). The Site is in downtown Guelph, southwest of the Speed River (Figure 2-1) and is approximately 1.14 ha in size. The Site is currently in use as a commercial parking lot and includes one laneway.

There are no buildings onsite; historical buildings (Figure 2-2a) were associated portions of the Site being used for parkland, commercial, and industrial purposes. From approximately 1827 to 1879 the parcel associated with 55 Baker Street was used a public burial ground (community land use). In 1892, a curling club was completed on the southern portion of the Site, and between the late 1890s and early 1900s, an industrial building (sewing machine and accessory manufacturer) was constructed in the central western portion of the Site. The industrial building and curling club were demolished in the early to mid-1960s and mid- to late 1960s, respectively. Subsequently, the Site was redeveloped into an asphalt parking lot (Pinchin 2018).

Historically, 152 and 160 Wyndham Street North were developed with commercial buildings during the mid-1800s. The northern portion of the parcel contained the American Hotel and a movie theatre, and an undertaker used the southern portion of the parcel. These properties were redeveloped for commercial retail use between 1916 and 1938, and remained so until between 2009 and 2013, at which point the buildings were demolished and replaced with an asphalt parking lot (Pinchin 2018).

6.10.1 Potentially Contaminating Activities

The Phase One ESA (Pinchin 2018) identified several PCAs within and outside the Site. Based on Jacobs' review of Pinchin 2018, as well as available historical environmental reports, aerial photographs, and FIPs, the following PCAs were identified on the Site, and resulted in an APEC (Figure 4-1a):

- 27 Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles
- 28 Gasoline and Associated Products Storage in Fixed Tanks
- 30 Importation of Fill Material of Unknown Quality
- 34 Metal Fabrication
- 48 Salt Manufacturing, Processing and Bulk Storage
- 55 Transformer Manufacturing, Processing and Use

The following PCAs were identified in the Phase One ESA (Pinchin 2018) and Phase One ESA Update (Jacobs 2021) outside the Phase Two Property, but on lands within 250 m the Site (that is, Phase Two Study Area) (Figure 4-1b):

- 27 Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles
- 28 Gasoline and Associated Products Storage in Fixed Tanks
- 31 Ink Manufacturing, Processing and Bulk Storage
- 34 Metal Fabrication
- 37 Operation of Dry Cleaning Equipment (where chemicals are used)
- 55 Transformer Manufacturing, Processing and Use

The specific descriptions of each PCA are provided in Table 4-2, including a rationale for whether the PCA results in an APEC on the Phase Two Property.

6.10.2 Areas of Potential Environmental Concern

Table 4-3 identifies the 8 APECs identified from onsite PCAs and the 14 APECs identified from offsite PCAs at the Phase Two Property. The following 22 APECs were identified within the Phase One ESA (Pinchin 2018) and supplemented by Jacobs as part of the Phase One ESA Update (Jacobs 2021) for the Phase Two Property (note, these are grouped by area, rather than in numerical order).

APECs from Onsite PCAs

- APEC-1: Historical Industrial Property Use: Coil wire springs, sewing machines, and accessories were historically manufactured at 55 Baker Street. (PCA 1)
- APEC-2: Unknown/Poor Quality Fill Material: The XCG Phase II ESA (XCG 2008) identified fill material to 3.0 mbgs at 55 Baker Street, and this is also likely located for the Wyndham properties, based on when they were developed (1862) after historical buildings had been demolished. (PCA 2)
- APEC-3: Historical Transformers: The 1960 FIP depicted an area of 55 Baker Street labelled as 'transformers.' (PCA 3)
- APEC-4: Use of Road Salts at the Property: The Site is currently used as a parking lot, and road salts are applied for vehicular and pedestrian safety. (PCA 56)
- APEC-18: Former Oil Shed: The 1911 FIP showed a small oil shed in the southwestern corner of the White Sewing Machine of Canada parcel of land on 55 Baker Street. (PCA 57)
- APEC-19: Former Oil House: The 1911 FIP showed a small oil house on the former White Sewing Machine of Canada parcel, now the western portion of 152 Wyndham Street. (PCA 58)
- APEC-20: Former Coke Storage: The 1911 FIP showed a garage located on the northeastern portion of 55 Baker Street. (PCA 59)

- APEC-21: Former Garage: The 1960 FIP showed a garage located on the northeastern portion of 55 Baker Street. (PCA 60)

APECs from Offsite PCAs to the North

- APEC-5: Historical Dry Cleaning: Potential dry cleaners were identified at 164 Woolwich Street. (PCA 5)
- APEC-6: Historical Retail Fuel Outlet and Automotive Repair/Servicing: identified at 160 Woolwich Street (PCA 4 and PCA 79); Historical Iron Foundry (PCA 78); Historical USTs: two gasoline USTs at 164-166 Woolwich (PCA 80)
- APEC-7: Historical Dry Cleaning: Potential dry cleaners were identified at 152 Woolwich Street.
 (PCA 12); Historical Garage: the 1929 FIP identified a garage at 166 Wyndham Street North (PCA 76);
 Historical UST: The 1929 FIP showed a gasoline UST at 168 Wyndham Street North (PCA 77)
- APEC-8: Historical Dry Cleaning: Potential dry cleaners were identified at 172 Wyndham Street North. (PCA 52)
- APEC-9: Historical Fuel Oil Underground Storage Tank: A historical underground storage tank was identified at 176 Wyndham Street North. (PCA 13)
- APEC-10: Historical Automotive Repair: A former automotive repair shop was identified at 176 Wyndham Street. (PCA 53)
- APEC-17: Historical Service Station: the 1946 and 1960 FIPs showed a service station with 3 associated gasoline USTs at 25 Suffolk (PCA 50); Historical Dry Cleaning: identified at 84 Yarmouth Street in 1955 (PCA 51); Historical Automotive Repair: identified at 27 Suffolk Street East (PCA 55); Historical Coach and Body Manufacturing: The 1946 FIP identified operations at 9-21 Suffolk Street East (PCA 81); Historical Industrial Property Use: sewing machine manufacturing was identified on the 1878 and 1892 FIPs at the corner of Suffolk and Yarmouth Streets (PCA 82).

APECs from Offsite PCAs to the East

- APEC-13: Historical Automotive Garage: A former garage was identified at 146 Wyndham Street North from 1930 to 1949. (PCA 18)
- APEC-15: Historical Dry Cleaning: Former dry cleaning operations were identified at 108 Wyndham Street North from 1917 to 1922. (PCA 19)

APECs from Offsite PCAs to the South

- APEC-14: Historical Gasoline Spill: Based on database searches, a historical gasoline spill at the intersection of Chapel Lane and Baker Street occurred, with possible environmental impacts to land and water. The quantity and exact location are unknown. (PCA 27)
- APEC-16: Historical Aboveground Storage Tank: Vent and fill pipes associated with an aboveground storage tank were observed at the corner of 20 Quebec Street (PCA 43); Historical UST: the 1946 FIP identified one UST under the roadway at 7 Quebec Street (PCA 25).

APECs from Offsite PCAs to the West

- APEC-11: Historical Offsite Industrial Operations: Cooke & Denison Machine and Tool Works was identified at 40 Baker Street from 1946 to 1960 (PCA 8); Historical UST: one UST identified on the 1946 FIP at 40 Baker Street (PCA 9); Historical Fuel Oil Tank: identified between 25 Yarmouth and 32-34 Baker Street properties on the 1960 FIP (PCA 71).
- APEC-12: Historical Automotive Garage: A former garage was identified at 45 Baker Street from 1946 to 1960 (PCA 6); Historical USTs: two USTS identified on Yarmouth Street (behind 45 Baker Street) on the 1929 and 1946 FIPs (PCA 7); Historical Industrial Operations: sewing machine manufacturing was identified between Yarmouth and Baker Streets on the 1878m 1892 and 1911 FIPs (PCA 70).

 APEC 22: Historical Dry Cleaning: Potential dry cleaning operations were identified at 2 Quebec Street in 1975 (PCA 11); Historical UST: identified at 2 Baker Street on the 1946 FIP (PCA 10); Former Coal Yard: identified on the 1892 FIP on the northwest corner of Quebec and Baker Streets (PCA 72).

Figure 4-2 shows the locations of the APECs and the current and historical borehole and monitoring wells. Table 6-4 shows, the Phase Two Property APECs have been investigated for the associated COPCs. Figure 2-2b shows several underground and overhead utilities are present in this area, including a gas line, water line, storm sewer, and several overhead hydro lines.

6.10.3 Subsurface Utilities and Construction Features

Utilities (including sanitary and storm sewers and water lines) were active and connected during the Phase Two ESA investigation, and are still present in the subsurface. Based on these utility connections, there is potential for the preferential flow of COCs within utility corridors. However, based on the following factors, COCs are most likely to be transported (that is, to migrate) via groundwater:

- Depth of groundwater (at least 3.78 mbgs [perched] and 5.82 mbgs [bedrock])
- Suspected depth of underground utilities (1.5 mbgs or deeper)
- Presence of permeable materials onsite (fill, sand, and sand and gravel identified from surface to bedrock at an average depth of 5.99 mbgs)

Figures 2-2a and 2-2b show building outlines and identified underground utilities, respectively, on the Phase Two Property.

6.10.4 Physical Setting

The topography over the Phase Two Property is moderately flat, with ground surface elevations ranging from 328.34 masl (MW113 in the south) to 330.16 masl (BH201 in the west). The Site slopes slightly from the western border towards the south, north, and east. Surface runoff at the Phase Two Property is expected to flow radially from the west in these directions but is directed towards onsite catchbasins. Figure 3-1 shows the regional topography and surface water drainage features. The Speed River is the nearest downgradient waterbody, located approximately 130 to 150 m north-northeast of the Site, and ground surface tends to slope north towards the river. Groundwater from the region is likely to eventually discharge to Speed River.

The City categorizes regions of Guelph within Wellhead Protection Areas (City 2018). The Site is within Wellhead Protection Area B (2-year travel time) for several of the City's municipal water supply wells. The nearest municipal wells to the Site include the Water Street, Edinburgh, Membro, and Dean Wells (approximately 1.4 to 2.0 km south of the Site past the Eramosa River), and the Park and Emma Wells (approximately 1.3 to 1.5 km north of the Site past the Speed River).

The municipal groundwater resource is primarily drawn from the Gasport Formation, estimated to occur at least 45 mbgs. A lower-permeability Reformatory Member and Vinemount Member of the Eramosa Formation are generally understood to serve as a regional aquitard, situated above the Gasport and limestone formations of the Goat Island Formation (Brunton 2009).

The City is also part of the Plan (Lake Erie Region Source Protection Committee 2021). The Plan assigns Drinking Water Threat Vulnerability Scores across the region based on various risk factors; the Phase Two Property is assigned a Vulnerability Score of 10, the highest possible, indicating it is susceptible to potential contamination. The Site is also in a highly vulnerable aquifer and issues contributing area but is not in a significant groundwater recharge area or in a source water intake protection zone. Figure 3-2 shows the Plan mapping and location of nearest municipal wells.

6.10.4.1 Stratigraphy

The Site is interpreted to consist of a predominantly sandy overburden overlying Guelph Formation dolostone bedrock. Within the northern portion of the Site, there is a thick silt deposit. Exhibit 6-1 summarizes the geological units encountered beneath the Site during the Phase Two ESA activities.

Exhibit 6-1. Site Stratigraphy

Geological Unit	Approximate Depth (mbgs)	Average Thickness (m)	Lithology
Asphalt	Up to 0.15		A thin layer of asphalt was observed.
Fill	0.15 to 3.91	1.87	Sand, sand and gravel, or silty sand were encountered. Silty clay and clayey silt were also observed. Anthropogenic materials such as brick, glass, metal products, and wood were commonly reported, as was iron oxide staining on the soil.
Native Overburden	0.81 to bedrock	See below	A sand matrix was encountered with interbedded layers of gravel and silt (described here), extending to bedrock. The sand is generally brown, dense, and moist.
Silt Layer	2.13 to bedrock	3.58	A silt layer was encountered in the northern portion of the Site. The silt was generally described as brown or grey, fine to coarse sand, low to high plasticity, with traces of gravel.
Silt Lens	2.21 to 3.72	1.37	A smaller silt lens was observed in the southern portion of the Site and is disconnected from the larger silt layer in the north of the Site. The silt in this lens was described as brown, hard and moist, with dolostone bedrock fragments observed.
Gravel and Sand	1.52 to 5.94	2.16	A layer of gravel and sand was encountered in the southern portion of the Site. The material was generally described as brown, dense, with fine to medium sand, trace clay, and occasional cobbles and dolostone fragments.
Clay Lens	1.14 to 2.44	1.30	A clay lens was encountered at a single location in the middle of the Site. As some other fill materials were described as being clayey, it is possible this is layer is also anthropogenic.
Guelph Formation dolostone	4.57 to 8.46 (top of bedrock range)	N/A	Generally, this dolostone was highly weathered and fractured within the first 0.3 to 0.6 m of bedrock contact. It was also noted to be vuggy, with calcite mineralization. The average depth to bedrock is 5.99 mbgs for the Site.

Geological cross-sections were prepared to show the Site stratigraphy. Figure 6-1 presents cross-section locations, and Figures 6-1a to 6-1d present cross-sections A-A,' B-B,' C-C,' and D-D,' respectively.

Based on the Site-specific geology, the main units investigated during the Phase Two ESA were an overburden composed of sand and interbedded silt and gravel, and bedrock.

6.10.4.2 Hydrogeological Characteristics

There are two main hydrogeological units encountered at the Site: (1) perched groundwater above a silt strata in the northern portion of the Site, and (2) a shallow unconfined aquifer generally in the upper bedrock, but extending in places up into the overburden soil (the 'perched groundwater' and 'bedrock aquifer,' respectively).

Twenty-one monitoring wells (18 wells from the current investigation and 3 historical wells) were used at the Phase Two Property to investigate conditions associated with the perched groundwater and the bedrock aguifer:

- Eighteen are installed in the bedrock aquifer.
- Three are installed to access the perched groundwater.

The bedrock monitoring wells are further defined as 'bedrock wells' for the 15 wells installed across or near the water table, and 'deep bedrock wells' for the three wells installed approximately 8 m into the bedrock, from 4.6 to 6.9 m below the water table for site characterization purposes. The site has been paved as a parking lot and is anticipated to receive low recharge from precipitation.

Figures 6-2a, 6-2b, and 6-2c present the interpreted groundwater elevation contours and flow directions within the bedrock (water table) using groundwater elevations collected during the monitoring events on September 11 and 18, 2019; December 18, 2019; and April 15, 2020, respectively.

Exhibit 6-2. Hydrogeological Characteristics

Groundwater Unit	Characteristic	Summary						
Bedrock	Flow Direction	Groundwater flows radially from a high elevation on the western boundary of the Site towards the north, and east to southeast. The higher groundwater elevations in the western portion of the Site appear to be correlated with higher bedrock layer elevation, as well as the topographical elevation and regional flow direction towards the Speed River.						
	Average Horizontal Hydraulic Conductivity	Range between September 18, 2019 and April 15, 2020: 4.6×10^{-7} to 2.0×10^{-4} m/s Geometric mean: 6.0×10^{-6} m/s The K of the bedrock was estimated based on slug testing in three wells (MW101, MW107, and MW109).						
	Average Horizontal Hydraulic Gradient	Estimated range between September 18, 2019 and April 15, 2020: 0.009 to 0.025 m/m Estimated average between September 18, 2019 and April 15, 2020: 0.016 m/m The maximum groundwater elevations within the bedrock aquifer were measured during the April 2020 monitoring event and were likely associated with snow melt and increased precipitation in the spring. Elevated groundwater levels may have "flattened" the gradient compared to fall and winter.						
	Groundwater Velocity	The horizontal linear groundwater flow velocity was estimated for the bedrock aquifer using the calculated geomean K value of 6.0×10^{-6} m/s, the estimated horizontal hydraulic gradient range of 0.009 to 0.025 m/m, and an estimated effective porosity of 0.1 for the weathered and fractured rock. The groundwater velocity within the bedrock is estimated to be approximately 24 to 47 m/y.						

Exhibit 6-2. Hydrogeological Characteristics

Groundwater Unit	Characteristic	Summary
Bedrock (cont'd)	Vertical Hydraulic Gradients	Vertical hydraulic gradients in the bedrock were calculated at two nested monitoring well sets: (1) MW107 and MW107B, and (2) MW110A and MW110B. The vertical hydraulic gradients observed were downwards and ranged from 0.062 m/m to 0.063 m/m at MW107 and MW107B and 0.042 m/m at MW110A and MW110B.

Notes:

cm/y = centimeters per year COC = contaminant of concern

The perched groundwater was observed at BH17-MW-5S, MW102A, and MW103 above a low-permeability silt aquitard layer. The K ranging from 3.6×10^{-8} to 7.4×10^{-7} m/s, with a geometric mean of 1.6×10^{-7} m/s. Vertical hydraulic gradients observed in this unit (MW102A and MW102B) were downward, ranging between 0.621 and 0.634 m/m, due to the influence of the perched groundwater above the silt layer observed at this well nest. The flow direction, horizontal hydraulic gradient, and groundwater velocity were not calculated because the perched groundwater was not present across the entire Site. The full extent of the perched groundwater is currently not fully understood but may have a similar extent to the silt layer.

6.10.4.3 Depth to Bedrock

The Guelph Formation Dolostone that underlies the Site was encountered between 4.57 and 8.43 mbgs (321.62 to 324.96 masl), with an average depth to bedrock of 5.99 mbgs (323.46 masl). The highest bedrock elevations were encountered along an approximate southwest-to-northeast transect of the Site (MW107, MW100, BH202, MW109, BH206). Note, higher groundwater elevations are also associated with these locations, and the groundwater contours presented on Figures 6-2a, 6-2b, and 6-2c appear to show a radial flow outward from this bedrock high, following the topography and moving towards the Speed River.

6.10.4.4 Depth to Water Table

The water table within the Phase Two Property is within the Guelph Formation dolostone bedrock unit; in the northern portion of the Site, perched groundwater is associated with a low-permeability silt layer.

The depth to the bedrock aquifer and the perched groundwater were assessed based on three groundwater level monitoring events (September 18, 2019; December 18, 2019; and April 15, 2020).

The depth to the bedrock aquifer ranged from 5.82 to 8.66 (322.90 to 321.13 masl). The depth to the perched groundwater ranged from 3.78 to 4.43 (325.74 to 325.04 masl) based on the three monitoring events.

6.10.4.5 Applicable Site Condition Standards

O. Reg. 153/04 (MECP 2011a), under Part XV.1 of the *Environmental Protection Act*, addresses the assessment, cleanup, and filing of a Record of Site Condition for brownfield sites in Ontario, and applies to the Phase Two Property. Jacobs evaluated the Site based on a number of criteria to decide which of the generic SCS provided in the *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act* (MECP 2011b) applied for a comparison of soil and groundwater results from the Phase Two ESA investigation.

Exhibit 2-3 outlines the items Jacobs considered when selecting the SCS, as outlined in O. Reg. 153/04 (MECP 2011a), discussed here.

The special conditions for environmentally sensitive areas under Sections 41 or 43.1 of O. Reg. 153/04 do not apply to the Phase Two Property:

- The Site is not considered an area of natural significance or to be within the proximity of an area of natural significance, based on the information reviewed as part of the Phase One ESA (Pinchin 2018).
- Jacobs analyzed 45 soil samples for pH from 17 locations across the Phase Two Property (Figure 2-3). Based on the results of the Jacobs investigation, soil pH was found to range from 7.37 to 9.46. Soil pH was within the MECP's acceptable range for samples collected in both surface soil (from between surface and 1.5 mbgs, with a pH value in surface soil less than 5 or greater than 9) and subsurface soil (more than 1.5 mbgs with a pH value in subsurface soil less than 5 or greater than 11). Historical investigations reported elevated pH (greater than 9) in surface soil samples; however, brick fragments or concrete were present in the stratigraphy where samples with elevated pH were collected based on a review of the borehole logs. This information suggests nonsoil materials may have been sampled, potentially biasing the historical soil pH results. Therefore, the historical results may not be representative of actual soil pH conditions. Based on this information, Jacobs has relied solely on the soil pH data collected during the recent investigation to determine the applicable SCS, and soil pH is within the MECP's acceptable range.
- The special conditions for land within 30 m of a water body under Section 43.1 of O. Reg. 153/04 do not apply to the Phase Two Property; no waterbodies are located on the Site or within 30 m of the Site. The Speed River is the nearest downgradient waterbody, located approximately 130 to 150 m north-northwest of the Site.
- The special conditions for shallow soil properties cited under Section 43.1 of O. Reg. 153/04 do not apply to the Phase Two Property; the depth to bedrock is greater than 2 m, as bedrock was encountered between 4.93 mbgs and 8.43 mbgs.

The adjacent properties within 250 m are serviced by a municipal water source. Since the groundwater near the Phase Two Property does and will serve as a raw water supply for a drinking water system (understood to be the Gasport Formation as the primary reservoir), the potable groundwater condition was applied.

The current land use is commercial and community (roads), and the proposed future land use may include residential/community and commercial uses, provided an RSC acknowledged by the MECP is obtained. Due to the extensive presence of heterogeneous fill materials across the Site, the standards for coarse-grained soils were considered applicable.

Based on this information reviewed by the QPESA, the Table 2 SCS was applied to the Site.

6.10.4.6 Imported Soil

Fill materials were identified across the Site to a maximum depth of 3.91 mbgs, or between 326.32 masl and 329.47 masl, with an average thickness of 1.68 m. The fill is variable in composition; however, the majority of fill is sand, sand and gravel, or silty sand.

The Phase One ESA (Pinchin 2018) reports that "significant quantities of fill material" have been identified onsite through previous Phase Two ESA investigations.

No soil was imported to the Site as part of Jacobs' recent Phase Two ESA activities.

6.10.4.7 Proposed Buildings and Other Structures

The City (2019) indicates the Site's redevelopment will include the following components:

- New Guelph Public Library
- Residential housing
- Commercial/institutional buildings
- Parking
- Urban square

The buildings' configuration is not known at this time.

6.10.5 Contaminants

6.10.5.1 Contaminants Exceeding Applicable Site Condition Standards in Soil and Groundwater

The Phase Two Property was found to be primarily impacted with salt-related analytes (that is, EC and SAR in soil; sodium and chloride in groundwater). Localized metal impacts were identified in soil, and localized cadmium impacts were identified in groundwater. PAH impacts identified from a historical investigation (Kewen 2001) were resampled and determined not to be representative of Site conditions. Elevated concentrations of chloroform in groundwater were attributed to well installation activities and not with PCAs or APECs.

Although identified as COPCs at the Site, the following parameters were not identified with exceedances of the Table 2 SCS onsite, either in soil or groundwater:

- BTEX
- VOCs
- PHCs
- ABNs
- D&Fs

Tables 6-5 and 6-8 summarize the analytical results of the investigation for soil and groundwater, respectively, and compare these compare to the Table 2 SCS. Figures are provided that present the locations of soil samples (Figures 6-4 through 6-12) and groundwater samples (Figures 6-13 through 6-19) analyzed and a comparison to the Table 2 SCS by analytical group. Where exceedances of the Table 2 SCS are present, at least one cross-section has been prepared presenting the inferred vertical extent of impacts by analytical group, and follows the plan view figure. Maximum concentrations of the parameters exceeding Table 2 SCS are shown in red text on the respective plan view and cross-sectional figures.

The following subsections discuss the soil and groundwater conditions found exceeding the Table 2 SCS on the Phase Two Property.

Other Regulated Parameters

EC and SAR exceedances of the Table 2 SCS were identified in soil across most of the Site, apart from the northeastern portions of the 152 and 160 Wyndham Street North parcels. Exceedances of the Table 2 SCS were also identified in groundwater for sodium and chloride across most of the Site (all monitoring wells were sampled, apart from MW109).

Exceedances of EC and SAR in soil were identified to a maximum depth of 7.92 mbgs (MW102B) and were present at depths extending from the ground surface to the bedrock surface. Maximum concentrations were identified at MW102B (EC) and MW113 (SAR) in the fill. Maximum concentrations of chloride and sodium in groundwater were identified at the northern end of the Site in MW102B.

Figures 6-4 and 6-13 show the detected exceedances and locations analyzed for other regulated parameters for soil and groundwater, respectively.

The presence of EC and SAR in soil and sodium and chloride in groundwater is likely a result of the application of deicing materials on the parking lot surfaces (APEC-4). Section 49.1 of O. Reg. 153/104 states the SCS is deemed not to be exceeded for the purpose of Part XV.1 of the Environmental Protection Act when a substance that has been applied to surfaces for the safety of vehicular or pedestrian traffic under conditions of snow or ice, or both, exceeds the SCS. Results are details in Tables 6-7c and 6-10c; at the discretion of the QPESA and based on the revised regulation, these parameters are not considered to be COCs at the Phase Two Property.

Metals (including Mercury, Methylmercury, and Hexavalent Chromium)

Based on the current investigation, metals exceedances of the Table 2 SCS in soil were identified within the southeastern portion of the Phase Two Property at one location (MW101; Figure 6-5) and were limited to lead and mercury. These impacts are likely limited to the fill in the existing laneways, based on results and observations during drilling and test pitting activities, and extend to an estimated maximum of 3.0 mbgs based on fill depth in this area (Figures 6-5a and 6-5b). The poor-quality fill was not observed at other locations.

Metals exceedances in groundwater were limited to cadmium. Exceedances occurred in two wells (MW107 and MW113) in the southwestern corner of the site (Figure 6-14), with maximum concentrations (6.16 μ g/L) found at MW113 (screened in the bedrock aquifer at 5.3 to 8.4 mbgs). The cadmium exceedances at these locations have been vertically delineated by MW107B (screened in the deep bedrock, at 13.7 to 15.5 mbgs), where concentrations were less than the Table 2 SCS (Figures 6-14a, 6-14b, and 6-14c).

Based on groundwater flow around monitoring wells MW107 and MW113, groundwater moves from these locations towards the southeastern portion of the Site. MW110A and MW101, located downgradient from the identified cadmium exceedances, have cadmium concentrations less than the Table 2 SCS. The identified cadmium impacts in groundwater are therefore not anticipated to migrate offsite.

Additional available downgradient data from MW106 (5.5 to 8.5 mbgs), which is located offsite, on adjacent City-owned property to the south, had reported concentrations of cadmium five times less than the Table 2 SCS. This, along with reported concentrations less than the Table 2 SCS at MW101 and MW110A, indicate onsite exceedances in groundwater are not likely migrating offsite to the nearest downgradient human receptors.

Metals exceedances in soil (lead and mercury) were identified within the fill (that is, not within native soils) and are potentially associated with historical industrial activities associated with the manufacturing of sewing machine accessories, and wire coils and springs (APEC-1) or general impacts associated with the fill identified onsite (APEC-2). Limited impacts were identified in groundwater at the Site (cadmium), which do not appear to correlate to the identified shallow metal impacts in soil. Therefore, it is unlikely that metal impacts in soil are acting as a source of contaminant mass contributing to the groundwater quality at the Phase Two Property. The onsite cadmium impacts may be related to the APECs associated with offsite and upgradient PCAs (to the west) (for example, APEC-11 for Industrial Operations, APEC-12 for Historical Automotive Garage) or other unknown sources.

Polycyclic Aromatic Hydrocarbons

PAH exceedances of the Table 2 SCS in soil were identified at one sample (historical BH-14, at 0.8 to 1.4 mbgs) within the west-central portion of the Site, containing an elevated concentration of dibenzo[a,h]anthracene within the fill materials. No exceedances of the Table 2 SCS were identified in native soils or in groundwater at the Site.

BH208 was advanced and sampled in the same location as historical BH-14, with PAH samples collected at 0.91-1.07 mbgs and 2.29 to 2.44 mbgs. The results were less than the Table 2 SCS, resulting in the combined average of the samples collected at the same depth interval also meeting the Table 2 SCS. It is the QPESA's opinion that the historical exceedance was likely related to the presence of asphalt directly above the sampling location and is not considered representative of soil conditions on the Site (Table 6-7c). PAHs are not considered a COC on the Phase Two Property.

Figures 6-8 and 6-17 show locations investigated for PAHs in soil and groundwater, respectively, in plan view.

Volatile Organic Compounds

Concentrations of chloroform in groundwater samples were reported exceeding the SCS, and the source of the exceedance was believed to be related to the municipal water that was used during the bedrock coring process. Jacobs encountered similar issues during a previous drilling program in Guelph in 2018. For that project, two samples (one from the water truck and one from the water truck hose that was used during the coring activities) were analyzed for VOCs. The VOCs were nondetect in the municipal water samples, apart from bromodichloromethane (12.5 to 12.9 μ g/L), dibromochloromethane (11.5 to 11.8 μ g/L), and chloroform (9.8 to 10.1 μ g/L). These analytes are trihalomethanes that are typically present in municipally treated water, substantiating that municipal water introduced during drilling activities was the likely source of trihalomethanes in groundwater. For the current project, VOCs were nondetect in groundwater apart from the same three analytes, and from one sample with low detections of 1,1-dichloroethane less than the Table 2 SCS.

Based on the available information, the QPESA determined there was a discharge of drinking water (within the meaning of the *Safe Drinking Water Act* [2002]), resulting in chloroform exceeding the SCS. Under Paragraph 2 of Section 49.1 of the revised O. Reg. 153/04, the SCS is deemed to not be exceeded for the purpose of Part XV.1 of the Act. Results are detailed in Table 6-10c, and at the discretion of the QPESA and the revised regulation, chloroform was not considered to be a COC for the Phase Two ESA.

6.10.5.2 Migration of Contaminants of Concern

COCs in soil were limited to lead and mercury in the fill unit, with no exceedances of the Table 2 SCS identified below approximately 3.7 mbgs (Figure 6-5b). As the minimum water table in the bedrock at the Site was measured at 5.82 mbgs, soil impacts are above the water table (Figure 6-5b); therefore, the potential for migration is limited.

Groundwater exceedances of the Table 2 SCS were limited to cadmium in two locations (MW113 and MW107) along the southern and western boundaries, respectively, where a groundwater high is located with radial groundwater flow from this area. Cadmium meets the Table 2 SCS at MW107B, providing vertical delineation for MW107 and MW113, along with two other wells (MW110B and MW111) screened in the deeper unconfined bedrock. Cadmium impacts have not been identified in downgradient or cross-gradient locations (MW105, MW100, MW110, and MW101 [Figure 6-14]), including available data from an offsite well (MW106) located adjacent to the southern edge of the property boundary. Based on this information, it is unlikely that the impacts are migrating off the Phase Two Property and the Site therefore meets the MECP drinking water component value (GW1) at the nearest offsite human receptors.

As there is no apparent soil source of the cadmium impacts onsite and groundwater impacts are found in the most upgradient locations onsite, these may be a result of migration from offsite sources from the west, or other urban fill (offsite); however, there is currently no direct evidence to confirm.

6.10.5.3 Climatic Conditions

Climatic or meteorological conditions that may have influenced the distribution and migration of COCs at the Phase Two Property include temporal fluctuations in groundwater levels. No atypical weather events that would be expected to influence COC transport are known to have occurred during Jacobs' investigation of the Phase Two Property. Changes in water elevations can affect the migration of contaminants.

6.10.5.4 Soil Vapour Intrusion

Vapour intrusion was not evaluated during this Phase Two ESA. No buildings are currently located on the Site. Buildings are planned as part of the redevelopment, but Jacobs understands all soil at the Phase Two Property will be removed to bedrock to facilitate the creation of underground parking. Therefore, soil vapour related to the existing concentrations in soil onsite will not be a concern under these future conditions.

Current or abandoned utilities may be a preferential pathway for potential contaminants, if present; however, as the utilities would be expected to be found in the depths corresponding to the presence of permeable fill and native sand and gravel (as discussed), the utility corridors are not expected to function as preferential pathways at the Phase Two Property.

6.10.6 Distribution of Contaminants

As Section 3 discussed, only metals in soil and groundwater exceeded the Table 2 SCS. As Figure 6-5 shows, soil exceedances for lead and mercury are limited to the southeastern corner of the Site. Similarly, groundwater exceedances of cadmium are localized to the southwestern portion of the Site (Figure 6-14). Cross-section Figures 6-5a and 6-5b for soil, and Figures 6-14a through 6-14c for groundwater, provide the vertical distribution of the metal exceedances at the Site and the water table elevations. In soil, metals exceedances are inferred to extend to approximately 3.5 mbgs within the fill, while in groundwater exceedances are inferred to extend to approximately 14.0 mbgs.

Figures 2-2a and 2-2b show building outlines and identified underground utilities on the Phase Two Property, respectively. As depth to utilities are unknown, these were not included on the applicable cross-section figures.

6.10.7 Contaminant Exposure Assessment

Figures 6-20a-b and 6-21a-b present the human health and ecological contaminant pathway and receptor models, respectively, based on current and potential future Site conditions. Figures 6-20a and 6-20b present the human health CSMs, with and without risk management measures, respectively. Figures 6-21a and 6-21b present the ecological conceptual site models, with and without risk management measures, respectively. The proposed future land use of the Site is residential, commercial, community, and institutional. The models present preliminary assessments of the exposure pathways that were further investigated as part of the risk assessment completed for the Phase Two Property (Jacobs 2020).

These figures identify the following five exposure pathways:

- 1) Release mechanisms The Phase Two Property became impacted as a result of historical Site operations (refer to the discussion on PCAs and APECs), when COCs were released to the ground (for example, via a spill or leak) or when contaminated soil was imported to the Site and placed as fill.
- 2) Contaminant transport pathways COCs released to soil may adsorb to soil or infiltrate deeper into the soil column. COCs in soil may also desorb and leach to groundwater or migrate vertically to the water table. COCs in soil can also be transported in the following ways: they can become airborne via wind or traffic erosion, be eroded by overland water flow, be taken up by vegetation planted in the soil, or volatilize to

outdoor air or indoor enclosed spaces. COCs in groundwater can be transported via vertical or horizontal groundwater flow, volatilization to outdoor air or indoor enclosed spaces, and uptake by vegetation.

- 3) **Human and ecological receptors located on, in, or under the Phase Two Property** Receptors currently present or expected to be present in the future at the Phase Two Property include:
 - Human Receptors residents, visitors, indoor workers, outdoor workers, construction workers, and utility workers
 - Ecological Receptors soil organisms, terrestrial plants, birds, and mammals
- 4) Receptor exposure points COCs can be contacted directly in soil or indirectly in outdoor and indoor air. COCs were not identified in groundwater.
- 5) Routes of exposure The primary routes of exposure by receptor type include:
 - Human Receptors
 - Direct contact with potable groundwater (ingestion or direct contact)
 - Direct contact with either soil or groundwater (incidental ingestion and dermal contact)
 - Inhalation of particulates (dust)
 - Inhalation of volatiles originating from a soil or groundwater source (indoor and outdoor air)
 - Ingestion of garden produce
 - Ecological Receptors
 - Direct contact with either soil or groundwater (ingestion and dermal)
 - Terrestrial plant root uptake from either soil or groundwater
 - Ingestion via terrestrial biota and prey

6.10.8 Nonstandard Delineation

Nonstandard delineation per O. Reg. 153/04 Schedule E, Section 7.1, was not conducted at the Site. Delineation was conducted to the requirements of O. Reg. 153/04 Schedule E, Section 7, for all COCs identified at the Site in soil and groundwater.

6.10.9 Reliance on Exemption on Site Condition Standard Exceedances

EC, SAR, sodium, chloride, and chloroform exceeded the Table 2 SCS; however, were not considered to be COCs at the Property based on the exemptions in Section 49.1 of O. Reg. 153/04 for meeting the site condition standards.

EC, SAR, chloride, and sodium were found widespread across the majority of the Site, at elevated concentrations. As the Site currently is in use as a commercial parking lot and laneway, the presence of EC, SAR, chloride, and sodium are related to the application of salt on the parking lot surface during winter conditions. The application of salt has been used for the safety of vehicular and pedestrian traffic. Under Paragraph 1 of Section 49.1 of the revised O. Reg. 153/04, the SCS is deemed to not be exceeded for the purpose of Part XV.1 of the *Environmental Protection Act* should a substance be applied to surfaces for the safety of vehicular or pedestrian traffic under conditions of snow or ice or both. Therefore, at the discretion of the QPESA, EC and SAR were not considered to be COCs for the Phase Two Property.

Concentrations of chloroform in groundwater exceeded the SCS, and the source of the exceedance was believed to be related to the municipal water that was used during the bedrock coring process. Based on a similar issue for a separate City project in 2018, water samples from the water truck and hose used during the coring activities reported elevated trihalomethanes: bromodichloromethane (12.5 to 12.9 μ g/L), dibromochloromethane (11.5 to 11.8 μ g/L), and chloroform (9.8 to 10.1 μ g/L). These analytes are trihalomethanes that are typically

present in municipally treated water, substantiating that municipal water introduced during drilling activities was the likely source of trihalomethanes in groundwater.

Based on the available information, the QPESA determined there was a discharge of drinking water (within the meaning of the *Safe Drinking Water Act*, 2002), resulting in chloroform exceeding the SCS. Under Paragraph 2 of Section 49.1 of the revised O. Reg. 153/04, the SCS is deemed to not be exceeded for the purpose of Part XV.1 of the Act. Therefore, at the discretion of the QPESA, chloroform was not considered to be a COC for the Phase Two ESA.

6.10.10 Reliance on Exemption Related to Excess Soils

Jacobs did not rely on Paragraph 3 of Section 49.1 of the revised O. Reg. 153/04.

7. Conclusions

Jacobs offers the following conclusions, based on the findings of the Phase Two ESA.

7.1 Site Characterization

Most of the soil beneath the Phase Two Property was found to be impacted with salt-related parameters (EC and SAR in soil; sodium and chloride in groundwater). Limited localized metal impacts were also present (lead and mercury in soil; cadmium in groundwater).

The presence of elevated EC and SAR in soil and sodium and chloride in groundwater is widespread across the majority of the Site, and is related to the application of de-icing materials on the parking lot surfaces (APEC-4). Section 49.1 of O. Reg. 153/104 states the SCS is deemed not to be exceeded for the purpose of Part XV.1 of the *Environmental Protection Act* when a substance that has been applied to surfaces for the safety of vehicular or pedestrian traffic under conditions of snow or ice, or both, exceeds the SCS. Therefore, at the discretion of the QPESA and based on the revised regulation, these parameters were not considered to be COCs at the Phase Two Property.

Metals exceedances in soil were identified within the southeastern portion of the Phase Two Property at one location (MW101) and were limited to lead and mercury. These impacts are likely limited to the fill in the existing laneways, based on results and observations during drilling and test pitting activities, and extend to an estimated maximum of 3.0 mbgs based on fill depth in this area. The poor-quality fill was not observed at other locations.

Metals exceedances in groundwater were limited to cadmium. Exceedances occurred in two wells (MW107 and MW113) in the southwestern corner of the site, with maximum concentrations found at MW113 screened in the bedrock aquifer (at 5.3 to 8.4 mbgs). The cadmium exceedances at these locations were not shown to extend vertically to MW107B (screened in the deep bedrock, at 13.7 to 15.5 mbgs). Based on groundwater flow around monitoring wells MW107 and MW113, groundwater moves from these locations towards the southeastern portion of the Site. Results from MW110A and MW101 (less than the Table 2 SCS), located downgradient from the identified cadmium exceedances, indicate the cadmium impacts in groundwater are not anticipated to migrate offsite.

Cadmium impacts may be related to the APECs associated with offsite and upgradient PCAs (to the west) (for example, APEC-11 for Industrial Operations and APEC-12 for Historical Automotive Garage) or other unknown sources.

Based on extensive sampling over the Phase Two Property, it has been concluded that the horizontal and vertical extents of soil and groundwater impacts have been sufficiently defined for Phase Two purposes, as well as to support the RA and an evaluation of risk management measures.

7.2 Phase Two Property Certification

Based on the results of the Phase Two ESA, concentrations of contaminants in soil and groundwater at the Phase Two Property did not meet the applicable standards. Property-specific standards were developed as part of an RA for the Phase Two Property (MGRA1896-20, IDS# 7882-BRYP6L), which was accepted by the MECP. Therefore, as of the certification date of April 29, 2020, the concentrations of contaminants in soil and groundwater at the Phase Two Property meet the property-specific standards as defined in the RA (Jacobs 2020). An RSC can be developed and submitted to the MECP, to permit the proposed change in land use for the Site.

7.3 Signatures

7.3.1 Report Preparation Procedures

This report was prepared by Ms. Victoria Peters, B.A.Sc., GIT, under the supervision of Ms. Tania McCarthy, P.Eng. QPESA. Senior technical review was conducted by Mr. Ed Taves, M.Sc., P. Geo. (Limited), QPESA.

The findings and conclusions of this report were supervised and reviewed by the undersigned QP.

As QPESA, I (Tania McCarthy) confirm I have supervised the carrying out of the Phase Two ESA, findings, and conclusions of this report.

As Senior Technical Reviewer for this report, I (Ed Taves) confirm I have completed a technical review of the Phase Two ESA and concur with the findings and conclusions of this report.

Sincerely,

Victoria Peters, B.Sc.Env., GIT

Site Assessor

Ed Taves, P.Geo. (Limited), QPESA

Project Manager and Senior Technical Reviewer

Tania McCarthy, P.Eng., QPESA Site Assessor

9. Limitations

This Phase Two ESA for the property municipally identified as 55 Baker Street, 152 Wyndham Street North, 160 Wyndham Street North, and the right-of-way known as Park Lane in Guelph, Ontario, was prepared for the City's exclusive use. Third parties cannot rely upon the findings and conclusions presented in this report without the express written consent of Jacobs and the City through an extension of reliance using a reliance letter signed by both parties. Jacobs accepts no responsibility for damages, if any, incurred by any third party as a result of decisions made or actions based on this report.

Note, Phase Two ESAs completed in accordance with the O. Reg. 153/04 have inherent limitations. The findings and conclusions regarding impacts at the Site are based solely on the extent of observations and information gathered during the Phase Two ESA.

The environmental characterization data were collected in general accordance with O. Reg. 153/04 – following the Phase One and Two ESA procedures. The sampling work was completed using standard engineering and scientific judgement, principles, and practices. The findings and conclusions regarding the contamination of the property are based solely on the extent of observations and information gathered during the Phase Two investigations. There are inherent limitations to this type of investigation.

The soil, groundwater, and environmental conditions, events, and observations described in this report are those observed at the time of the investigation. Environmental Site conditions vary. Interpretations of groundwater levels and flow direction are based on water level measurements at selected monitoring well locations and are expected to fluctuate. Borehole and monitoring well observations indicate the approximate subsurface conditions at those locations only. Boundaries between zones are often not distinct; rather, they may be transitional and were interpreted. Subsurface conditions between boreholes, monitoring wells, and sampling locations were inferred and may vary significantly from conditions encountered at those locations.

The City should be aware that, with the nature of this type of work, there are inherent limitations, as outlined in the CSA Group Standard (CAN/CSA-Z769-00), Section 3.9.2:

Even when Phase II work is executed with an appropriate standard of care, certain conditions such as substances of concern that are under buildings or of low mobility, can present especially difficult detection problems.

It shall be recognized that samples taken represent one discrete portion of any Site at any given time, and may or may not be representative of the entire Site or the portion in question.

The findings of these characterization activities are based on observations and findings recorded by Jacobs during Site visits and reconnaissance, and also on data and information provided by the City and third parties; this information was not independently verified by Jacobs, and Jacobs has assumed this information to be accurate, complete, reliable, noninfringing, and fit for the intended purpose.

This is a technical report and is not a legal representation or interpretation of environmental laws, rules, regulations, or policies of governmental agencies.

The investigation activities were formed on historical reports and the information gathered during the Phase One ESA activities. However, Jacobs cannot warrant or guarantee that the information provided in this summary is absolutely complete or accurate beyond current environmental engineering consulting standards. Jacobs assumes no responsibility for conditions that it was not authorized to investigate or that were not within its specific scope of work.

Jacobs believes this report to be accurate; however, Jacobs disclaims any warranty of the completeness or accuracy of information supplied to Jacobs that was relied upon in the preparation of this report.

All findings and conclusions stated in this summary are based on facts and circumstances as they existed during the investigation. Any changes in fact or circumstances upon which the summary was based may change the findings reported. Jacobs cannot report on, or accurately predict, events that may change the Site conditions after the described investigation was completed.

Other considerations and limitations applicable to this Phase Two ESA also include the following.

9.1 Standard of Care and Limitation of Liability

- a) Jacobs' services are governed by the negligence standard for professional services, measured as of the time those services are performed.
- b) Jacobs shall not be liable to the City for any damages where it has exercised a reasonable standard of care.

9.2 No Third-party Beneficiaries

- a) This Phase Two ESA Report gives no rights or benefits to anyone other than the City and Jacobs and has no third-party beneficiaries. All work products prepared are for the sole and exclusive use of the City for specific application to the property described in the Agreement, is not for the benefit of any third party, and may not be distributed to, disclosed in any form to, used by, or relied upon by any third party without the prior written consent of Jacobs, which consent may be withheld in its sole discretion.
- b) No warranty, expressed or implied, is made regarding the services performed.
- c) If the City requests Jacobs' consent for a third party to depend upon an ESA Report as part of the City's financing efforts or in connection with decisions regarding redevelopment, sales, or acquisitions, such consent will be considered given upon the third party's execution of a Reliance Letter as provided by Jacobs.

9.3 Existing Site Conditions

- a) Any opinions or recommendations presented apply to Site conditions existing when services were performed. Jacobs cannot report on or accurately predict events that may change the Site conditions after the described services are performed, whether occurring naturally or caused by external forces.
- b) Jacobs assumes no responsibility for conditions we are not authorized to investigate, or which are not in our specific Scope of Work. Unknown contamination may be exposed during excavation.
- c) Jacobs' services shall not include an independent verification of the quality of work conducted and information provided by independent laboratories or other independent contractors retained by Jacobs in connection with Jacobs' services.

In preparing this Phase Two ESA, Jacobs relied, in whole or in part, on data and information provided by the City and third parties, which information was not independently verified by Jacobs, and which Jacobs has assumed to be accurate, complete, reliable, and current. Therefore, while Jacobs has utilized its best efforts in preparing this Phase Two ESA, Jacobs does not warrant or guarantee the conclusions set forth in this Phase Two ESA that are dependent or based upon data, information, or statements supplied by third parties or the City.

Tables

Table 3-1. Summary of Environmental Reports

55 Baker Street, 152 and 160 Wyndham Street North and Park Lane, Guelph, Ontario

Summary	Field Program	Field Program Results and Other Observations	Data or Information Relied Upon?	Steps Take to Ensure Data or Information is Reliable or Updated (Screening Data)
XCG Environmental Services Inc. 1993. Gu	elph Hydro Phase I/Phase 2 Enviro	nmental Audits of Five Transformer Station Properties. Prepared for G	uelph Hydro. November.	
Soil samples were collected from within transformer compounds specifically between transformer bases or between the transformer base and entrance gates. Transformer Station MS12 is associated with the Phase Two Property.	 One soil sample (SA9) analyzed for PCBs and Metals 	 PCBs in soil exceed the current Table 2 SCS Metals (Cd, Cu, Zn) exceed the current Table 2 SCS 	 PCB data may not represent current conditions as Kewen report (2001) indicates "cleanup" activities. Data used for screening only. Metals soil data is not considered suitable for RSC purposes. Data used for screening only. 	 Additional soil samples collected at and in the vicinity of SA9 (BH200 and BH209) and analyzed for PCBs. Additional soil samples collected at and in the vicinity of SA9 (BH200 and BH209) and analyzed for metals to update previous results.
Kewen Environmental Limited. 2001. Baker	r Street Parking Lot, City of Guelph,	Ontario, Phase II Environmental Site Assessment. Prepared for The C	ty of Guelph. August 7.	
Investigation in follow-up to a Phase One ESA. Eleven boreholes and three monitoring wells were advanced. Report indicates that the transformer station was removed in 1989 and that "cleanup" activities were completed around the former transformers in 1998. Two of the three monitoring wells installed were dry.	 Two soil samples analyzed for VOCs Eleven soil samples analyzed for pH, EC, and metals One groundwater sample analyzed for metals, sodium, chloride, and general chemistry 	 VOCs in soil meet the current Table 2 SCS Soil pH greater than 9 in five surface samples EC in soil exceed the current Table 2 SCS (9 samples) Pb and Zn in soil exceed the current Table 2 SCS (2 samples) Metals in groundwater met the current Table 2 SCS, with the exception of antimony; sodium and chloride exceed the current Table 2 SCS (1 sample) 	 VOC soil data is not considered suitable for RSC purposes. Data used for screening only. Soil pH and EC data is not considered suitable for RSC purposes. Data used for screening only. Metals soil data is not considered suitable for RSC purposes. Data used for screening only. Groundwater data from 2001 is not considered suitable for RSC purposes as it is not representative of current conditions. Data used for screening only. 	 Additional soil analysis for VOCs, pH, EC, and metals has been conducted across the Site to confirm the presence of absence of historical impacts under current conditions using O. Reg. 153/04 protocols. Additional groundwater analysis for metals, sodium, and chloride has been conducted across the Site to confirm the presence or absence of historical impacts under current conditions using O. Reg. 153/04 protocols.
XCG Consultants Limited. 2008. Phase II En	nvironmental Site Assessment, Bak	er Street Redevelopment Site, Guelph, Ontario. Prepared for The City o	f Guelph. December 19.	
Investigation in follow-up to a Phase One ESA. Twenty boreholes and seven monitoring wells were advanced.	 Eight soil samples analyzed for BTEX and VOCs Twenty soil samples analyzed for metals (excluding uranium) Four soil samples analyzed for PAHs and PCBs Sixteen samples analyzed for PHCs Nineteen soil samples analyzed for pH Eleven groundwater samples for BTEX, VOCs, Metals, sodium, and PHCs One groundwater sample for PCBs 	 BTEX and VOCs in soil meet the current Table 2 SCS Lead in soil exceed the current Table 2 SCS (2 samples) PAHs in soil exceed the current Table 2 SCS (1 sample) PCBs in soil meet the current Table 2 SCS PHCs in soil exceed the current Table 2 SCS (1 sample) Soil pH greater than 9 in two surface samples BTEX and VOCs in groundwater meet the current Table 2 SCS Ba (1 location), Cd (1 location), and Co (1 location) in groundwater exceed the current Table 2 SCS Sodium (9 locations) in groundwater exceed the current Table 2 SCS PHC F4 in groundwater (1 location) exceed the current Table 2 SCS PCBs in groundwater meet the current Table 2 SCS 	 All soil data from this investigation, apart from the pH data, is considered suitable for RSC purposes. Metals data is missing uranium analysis, but is considered suitable for RSC purposes. Groundwater data from 2008 is not considered suitable for RSC purposes as it is not representative of current conditions. Data used for screening only. 	 Review of borehole logs indicates that concrete or brick fragments may have been included in soil samples submitted for pH. Therefore, soil pH results may be biased high and not representative of actual conditions. Additional soil analysis for pH has been conducted across the Site as part of the current investigation. COAs are available for all soil samples. All soil analysis was completed using O. Reg. 153/04 protocols applicable at the time of the investigation. Uranium was not regulated under O. Reg. 153/04 at the time of investigation and is missing from the Metals analysis suite. Uranium has not been specifically identified as a COC for the Site. As such, the Metals analysis from the 2008 investigation is considered usable and reliable. Additional soil sampling for uranium has been conducted across the Site as part of the current investigation. Additional groundwater analysis for metals, sodium, and PHCs has been conducted across the Site to confirm the presence or absence of historical impacts under current conditions using O. Reg. 153/04 protocols.

Notes:

Ba = barium

BTEX = benzene, toluene, ethylbenzene, and xylenes

Cd = cadmium

COA = certificate of analysis

COC = contaminant of concern

Cu = copper

EC = electrical conductivity

ESA = environmental site assessment

mbgs = metre(s) below ground surface

MECP = Ontario Ministry of the Environment, Conservation and Parks

O. Reg. = Ontario Regulation

PAHs = polycyclic aromatic hydrocarbons

Pb = lead

PCBs = polychlorinated biphenyls

PHCs = petroleum hydrocarbons

RSC = Record of Site Condition

SCS = site condition standard

VOCs = volatile organic compounds

Zn = zinc

Table 4-1. Phase One Conceptual Site Model

Phase One ESA Summary, 55 Baker Street, 152, 160 Wyndham Street North and Park Lane, Guelph, Ontario

Thase one Estimation, oo bar	Rer Street, 152, 160 Wynanam Street North and Park Lane, Guetph, Ontario
Phase One CSM Element	Summary
Existing Buildings and Structures	No buildings exist on the Phase One Property. The Site consists of two asphalt parking lots (55 Baker Street, 152 and 160 Wyndham) and an asphalt laneway (Park Lane).
Identify Water Bodies in the Phase One Study Area	The Speed River is located approximately 130 to 150 m north-northeast of the Phase One Property.
Areas of Natural Significance	No areas of natural significance were identified within the Phase One Study Area.
Presence of Drinking Water Wells	No drinking water wells were identified on the Phase One Property. The Site and surrounding properties are serviced with potable water obtained from municipal groundwater supply wells located within the City of Guelph. Water wells within 500 m of the Site listed in the Ontario Water well records database are shown on Figure 6 of the Phase One ESA Update (Jacobs, 2021).
Identify Roads within the Phase One	Figure 7 of the Phase One ESA Update (Jacobs, 2021) presents the roadways and land uses within the Phase One Study Area.
Adjacent Property Uses	Figure 7 of the Phase One ESA Update (Jacobs, 2021) and Figure 3 of the Phase One ESA (Pinchin 2018) presents the adjacent property use: • To the north: commercial/industrial and residential • To the east: commercial/industrial and mixed use residential/commercial • To the south: residential, commercial/industrial and mixed use residential/commercial • To the west: residential, commercial/industrial and mixed use residential/commercial
Identify PCAs in the Phase One Study Area	A total of 129 PCAs were identified in the Phase One Study Area and are shown on Figure 4-1a and 4-1b along with approximate locations of historical USTs. Details and descriptions of the PCAs are provided in Table 4-2, and indicate which PCAs result in an APEC.
Identify APECs	The Phase One ESA (Pinchin, 2018) and Jacobs identified twenty-two APECs for the Phase One Property, eight attributable to onsite PCAs, and 14 attributable to offsite PCAs. APECs and are listed in Table 4-3 and shown on Figure 4-2.
COPCs	The COPCs identified by Jacobs from a review of the Phase One ESA (Pinchin, 2018) include metals (including hydride-forming metals), other regulated parameters (hot water soluble (HWS) boron, cyanide, EC, SAR, sodium, chloride, mercury, hexavalent chromium), VOCs, BTEX, PHCs, PAHs, dioxins/furans and ABNs.
Presence of Underground Utilities	Underground utilities on the Phase One Property provide electrical services to the light standards and pay meters, in addition to storm sewers which provide the drainage to the parking lots. The Site Representative indicated that a parking attendant building was recently demolished in 2016 on the west central portion of the property. The building was serviced by municipal water and was connected to the sanitary sewer system. Additionally, several buildings were historically present on the Phase One Property as shown on Figure 2-2a. It is unclear if utilities associated with these former buildings remain on the Phase One Property. Estimated depths of the utilities are 1 mbgs for electrical utilities, and 3 mbgs for storm sewers. Previous reports indicate that groundwater was encountered at depths of approximately 3.5 to 8.9 mbgs, therefore utility corridors are expected to be present above the water table and would not act as a preferential pathway for contaminant distribution and transport. It is unclear if historical utilities resulting from the historical industrial use on the Phase One Property are still present. Known utilities are presented on Figure 2-2b.
Regional/Local Geology	The Phase One Property and surrounding properties are located within the physiographical area identified as the Guelph Drumlin Field. Glacialfluvial outwash deposits of sands and gravel occur, underlain in places by fine-graines silts and clays, overlying dolostone bedrock. Native subsurface materials encountered during previous investigations (XCG, 2008), consisted of silty sand, silt and gravel, cobbles, sand and silt. No bedrock outcrops were observed on Site or in the surrounding area. Based on information provided in previous investigations (XCG, 2008), the overburden thickness ranges between approximately 4.3 and 7.3 m.
Regional/Local Hydrogeology	The Phase One Property is relatively flat, with a slight slope to the south. The surrounding area slopes gradually to the south and east towards the Speed River as shown on Figure 3-1. The Speed River is located 130 m north-northeast and 440 m east of the Site, and flows southeast and discharges into the Grand River located approximately 19 kilometres south of the Site. Based on an elevation survey completed as part of previous investigations (XCG, 2008) the groundwater at the Site flows in an east-southeast direction towards the Speed River.
Uncertainties Affecting the Validity of Phase One CSM	On the basis of the uncertainties presented within the Phase One ESA report, it is possible that a PCA/APEC or land use has not been identified within the individual components of the Phase One ESA. Information was gathered from numerous sources (that is, aerial photographs, City Directories, database searches, historical reports, interviews, and site reconnaissance), which decreases the chance that a major PCA or land use was not identified in this Phase One ESA. Many aspects of the CSM have been previously studied and verified through subsurface investigations (for example, groundwater flow direction); these aspects are not directly affected by the noted uncertainties: Quality of aerial photographs may not allow some features to be clearly identified, and professional judgment was used to relate the historical features identified in the aerial photographs to present day locations Municipal addresses are known to change Information provided by interviewed individuals, could be based on hearsay or personal opinion

Notes:

This Phase One Conceptual Site Model was prepared by Jacobs based on the Phase One Environmental Site Assessment prepared by Pinchin (2008) and the information reviewed as part of the Phase One ESA (Jacobs 2021) Update.

ABN = Acid base neutral mbgs = metre(s) below ground surface

APEC = Areas of Potential Concern PAH = Polycyclic aromatic hydrocarbon

BTEX = benzene, ethylbenzene, toluene and xylenes PCA = Potentially Contaminating Activity

COPC = Contaminant of Potential Concern Phase One Property = 55 Baker Street, 152 and 160 Wyndham Street N, Park Lane

CSM = Contaminant of Potential Concern

CSM = Contaminated Sites Model

PHC = Petroleum hydrocarbon

EC = electrical conductivity

SAR = sodium adsorption ratio

ESA = Environmental Site Assessment

UST = underground storage tanks

masl = metre(s) above sea level

VOC = volatile organic compound(s)

masl = metre(s) above sea level

VOC = volatile organic compound(s)

57	Vehicles and Associated Parts Manufacturing	81	Historical Coach and Body Manufacturing - Guelph Coach & Body is located at 9-21 Suffolk Street East on the 1946 FIP. Buildings include Auto accessories, glazing, upholstering, office, glass storage and printing.	9-21 Suffolk Street East	Offsite	YES	APEC-17	Hydraulically upgradient/ transgradient to the Phase One Property	FIP
34	Metal Fabrication	82	Historical Industrial Property Use - Sewing machine manufacturing (Chas Raymond's Sewing machine Mfg) was indicated on the 1878 and 1892 FIP, located at the southeast corner of Suffolk and Yarmouth.	Suffolk and Yarmouth Street	Offsite	YES	APEC-17	Hydraulically upgradient/ transgradient to the Phase One Property	FIP
28	Gasoline and Associated Products Storage in Fixed Tanks	57	Former Oil Shed – The 1911 FIP showed a small oil shed in the southwestern corner of the White Sewing Machine of Canada parcel of land on 55 Baker Street.	Southwest portion of 55 Baker Street	Onsite	YES	APEC-18	PCA on the Phase One Property	FIP
28	Gasoline and Associated Products Storage in Fixed Tanks	58	Former Oil House – The 1911 FIP showed a small oil house on the former White Sewing Machine of Canada parcel, now the western portion of 152 Wyndham Street.	Western portion of 152 Wyndham Street North	Onsite	YES	APEC-19	PCA on the Phase One Property	FIP
Other	Activity not defined in O. Reg. 153/04 Table 2 of Schedule D	59	Former Coke Storage – The 1911 FIP showed a garage located on the northeastern portion of 55 Baker Street.	Northeast portion of 55 Baker Street	Onsite	YES	APEC-20	PCA on the Phase One Property	FIP
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	60	Former Garage – The 1960 FIP showed a garage located on the northeastern portion of 55 Baker Street.	Northeast portion of 55 Baker Street	Onsite	YES	APEC-21	PCA on the Phase One Property	FIP
28	Gasoline and Associated Products Storage in Fixed Tanks	10	Historical UST - One UST identified within the northwest portion of 2 Baker Street (historically 22 Baker Street), in a building labeled 'auto' occupied by Guelph Creamery (1946 FIP).	2 Baker Street	Offsite	YES	APEC-22	Hydraulically upgradient and adjacent to the Phase One Property	FIP
37	Operation of Dry Cleaning Equipment (where chemicals are used)	11	Historical Dry Cleaning - Ferguson's Cleaners, a potential dry cleaning operation was listed in the city directories at 2 Quebec Street in 1975.	2 Quebec Street	Offsite	YES	APEC-22	Hydraulically upgradient and adjacent to the Phase One Property	CDL
Other	Activity not defined in O. Reg. 153/04 Table 2 of Schedule D	72	Former Coal Yard - A coal yard is identified on the northwest corner of Quebec and Baker Streets.	Quebec and Baker Street	Offsite	YES	APEC-22	Hydraulically upgradient/ transgradient of the Phase One Property	FIP
55	Transformer Manufacturing, Processing and Use	14	Transformer - One pad-mounted oil cooled transformer was identified during the Pinchin Site Visit (in 2018) on the west exterior portion of 138 Wyndham Street North. No staining was observed on the concrete slab in the vicinity of the transformer, and no evidence of leakage was observed during the Site reconnaissance.	Behind 138 Wyndham Street North	Offsite	NO		Hydraulically upgradient/ transgradient of the Phase One Property, but nature of PCA is shallow soil contamination	SR
28	Gasoline and Associated Products Storage in Fixed Tanks	15	Historical Service Station - a former auto servicing and refueling station was located at 145 Woolwich with 4 gasoline USTs located out front, on Woolwich Street. The service station existed from at least 1929 to 1960 based on the FIPs and city directories (Simpson, CT, Service Station).	145 Woolwich Street	Offsite	NO		Hydraulically downgradient of the Phase One Property	FIP, CDL
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	16	Historical Automotive Repair - Auto repair/servicing activities by Muller Bros were present at 135-139 Woolwich Street from at least 1936 until 1960 based on FIPs and city directories.	135-139 Woolwich Street	Offsite	NO		Hydraulically downgradient of the Phase One Property	FIP, CDL
28	Gasoline and Associated Products Storage in Fixed Tanks	17	Diesel AST - One emergency diesel-fired emergency generator with an associated belly-tank was identified or the west exterior portion of 138 Wyndham Street North during the Pinchin Site Visit (in 2018). No staining was observed on the concrete slab in the vicinity of the emergency generator and no evidence of leakage was observed during the Site reconnaissance.		Offsite	NO		Hydraulically upgradient/ transgradient of the Phase One Property, but nature of PCA is shallow soil contamination	SR
31	Ink Manufacturing, Processing and Bulk Storage	20	Historical Printing Operation - Printing indicated in back of 90-96 Wyndham Street North on the 1929 and 1946 FIPs. City directories list Kelso Printing Co., at 96 Wyndham Street North in 1936.	96 Wyndham Street North	Offsite	NO		Hydraulically downgradient of the Phase One Property	FIP, CDL
37	Operation of Dry Cleaning Equipment (where chemicals are used)	21	Potential Historical Dry Cleaning - "Chinese Laundry" was identified at 70 Wyndham Street North on the 1911 and 1916 FIP. Based on city directory searches, these operations were present until approximately 1922 under Young Wong Laundry. It is noted that this laundry service was typically hand-laundry and not likely dry cleaning; in addition, PCE was not being readily used in dry cleaning until the 1930s.	70 Wyndham Street North	Offsite	NO		Hydraulically transgradient, and distance is greater than 50 m from the Phase One Property	FIP, CDL

Potentia (1)	ally Contaminating Activity (PCA)	PCA Unique ID	Descriptions of PCAs (in Phase One ESA Summary) (2)	Property Address / Location of PCA Onsite	Location of PCA (3)	PCA results in	Resulting APEC	Rationale ⁽⁴⁾	Information Source
37	Operation of Dry Cleaning Equipment (where chemicals are used)	22	Potential Historical Dry Cleaning - "Chinese Laundry" was identified at 55-57 Quebec Street from approximately 1910 to 1946 based on FIPs and city directories (Lee Wing Laundry present from 1910 to 1939). It is noted that this laundry service was typically hand-laundry and not likely dry cleaning; in addition, PCE was not being readily used in dry cleaning until the 1930s.	55-57 Quebec Street	Offsite	NO		Based on site-specific groundwater flow, this location is hydraulically transgradient from the Phase One Property. Distance is greater than 50 m from the Phase One Property	FIP, CDL
37	Operation of Dry Cleaning Equipment (where chemicals are used)	23	Potential Historical Dry Cleaning - "Cleaning and Pressing" at 49 Quebec Street on 1911 and 1916 FIPs, and Chas Kutt cleaner listed in the city directories from 1910 to 1916. It is noted that PCE was not being readily used in dry cleaning until the 1930s.	49 Quebec Street	Offsite	NO		Based on site-specific groundwater flow, this location is hydraulically transgradient from the Phase One Property. Distance is greater than 50 m from the Phase One Property	FIP, CDL
37	Operation of Dry Cleaning Equipment (where chemicals are used)	24	Potential Historical Dry Cleaning - Starkman Cleaning and Pressing, a potential dry cleaning operation was listed at 31 Quebec Street, from 1916 until 1917. It is noted that PCE was not being readily used in dry cleaning until the 1930s.	31-35 Quebec Street	Offsite	NO		Based on site-specific groundwater flow, this location is hydraulically transgradient from the Phase One Property. Distance is greater than 50 m from the Phase One Property	CDL
37	Operation of Dry Cleaning Equipment (where chemicals are used)	26	Potential Historical Dry Cleaning - a building labelled 'cleaning and pressing', a potential dry cleaning operation was identified at 17 Quebec Street in the 1946 FIP.	17 Quebec Street	Offsite	NO		Based on site-specific groundwater flow, this location is hydraulically transgradient from the Phase One Property. Distance is greater than 50 m	FIP
28	Gasoline and Associated Products Storage in Fixed Tanks	28	Historical Service Station and USTs - The 1929 and 1946 FIPs identified a gasoline UST at 88 Norfolk Street, ir front of the automotive garage on Norfolk Street. The 1960 FIP identifies a gasoline service station in place of the garage, with 3 USTs within the property and an associated address of 90 Norfolk Street.	Norfolk and Commercial Street (88 / 90 Norfolk Street)	. Offsite	NO		Hydraulically upgradient/ transgradient, but distance is greater than 100 m from the Phase One Property	FIP
28	Gasoline and Associated Products Storage in Fixed Tanks	29	Historical UST - the 1946 FIP identified one gasoline UST at 17 Quebec Street	behind 19-23 Quebec Street	Offsite	NO		Based on site-specific groundwater flow, this location is hydraulically transgradient from the Phase One Property. Distance is greater than 50 m from the Phase One Property	FIP
37	Operation of Dry Cleaning Equipment (where chemicals are used)	30	Potential Historical Dry Cleaning - "Chinese Laundry" was indicated at 13 Quebec Street on the 1916 FIP. The city directories indicate Ontario Laundry is present from 1917 to 1930. It is noted that this laundry service was typically hand-laundry and not likely dry cleaning; in addition, PCE was not being readily used in dry cleaning until the 1930s.		Offsite	NO		Based on site-specific groundwater flow, this location is hydraulically transgradient from the Phase One Property. Distance is greater than 50 m from the Phase One Property	FIP, CDL
28	Gasoline and Associated Products Storage in Fixed Tanks	31	Historical Gasoline Service Station - a refueling station with 3 associated USTs is identified on the 1946 FIP at 46-48 Cork Street East.	46-48 Cork Street East	Offsite	NO		Hydraulically transgradient, and distance is greater than 50 m from the Phase One Property	FIP
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles		Historical Automotive Repair - a garage is identified on the 1916 to 1960 FIPs at 23-25 Cork Street East.	23-25 Cork Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
28	Gasoline and Associated Products Storage in Fixed Tanks	33	Historical UST - the 1929 to 1960 FIPs identify one UST in front of the garage at 23-25 Cork Street East	23 Cork Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
37	Operation of Dry Cleaning Equipment (where chemicals are used)	34	Potential Historical Dry Cleaning - "Chinese Laundry" was indicated at 34 Quebec Street on the 1911 FIP. Elm Bros Laundry was identified in the city directories at 34 Quebec Street from 1910 until 1916. It is noted that this laundry service was typically hand-laundry and not likely dry cleaning; in addition, PCE was not being readily used in dry cleaning until the 1930s.	34 Quebec Street	Offsite	NO		Based on site-specific groundwater flow, this location is hydraulically transgradient from the Phase One Property. Based on the nature of the indicated services, the likelihood that the	FIP, CDL
28	Gasoline and Associated Products Storage in Fixed Tanks	35	Historical Oil Cellar - Bond Hardware Co. Ltd. was located at 42-56 Wyndham Street North. This property was labelled on the 1892, 1911 and 1916 FIPs as containing an 'oil cellar under the sidewalk' at the northwest exterior corner of this building.	St. George Square	Offsite	NO		Hydraulically transgradient, and distance is greater than 50 m from the Phase One Property	FIP
31	Ink Manufacturing, Processing and Bulk Storage	36	Historical Printing Operation - Clark Printer, a historical printing operation was listed in city directories at 14 Wyndham Street North in 1901.	14 Wyndham Street North	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	CDL

Potentia	lly Contaminating Activity (PCA)	PCA Unique	Descriptions of PCAs (in Phase One ESA Summary) (2)	Property Address / Location of PCA Onsite	Location of PCA (3)	PCA results in Resultin	Rationale ⁽⁴⁾	Information Source

Printers, a historical printing operation was listed in city directories at 13 Wyndham Street North in 1901.	13 Wyndham Street North	Offsite	NO APEC	Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	CDL
28	Gasoline and Associated Products Storage in Fixed Tanks	38	Historical UST - the 1946 FIP identified one UST at 106 Quebec Street	106 Quebec Street	Offsite	NO	Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	39	Historical Automotive Repair - 'Garage & Repairs' were identified in the 1946 FIP at 106 Quebec Street.	106 Quebec Street	Offsite	NO	Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP
	Ink Manufacturing, Processing and Bulk Storage	40	Historical Printing Operation - Herald Printing, a historical printing operation was identified at 65 Quebec Street in the 1892, 1897, and 1911 FIPs.	65 Quebec Street	Offsite	NO	Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP
37	Operation of Dry Cleaning Equipment (where chemicals are used)	41	Potential Historical Dry Cleaning - Based on city directories Sam Sing Landry, a potential dry cleaning operation was identified at 146 Quebec Street in 1917 until 1939. It is noted that this laundry service was typically hand-laundry and not likely dry cleaning; in addition, PCE was not being readily used in dry cleaning until the 1930s.	146 Quebec Street	Offsite	NO	Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	CDL
37	Operation of Dry Cleaning Equipment (where chemicals are used)	42	Potential Historical Dry Cleaning - Chinese Laundry, a potential dry cleaning operation was identified at 101 Quebec Street in 1910 until 1944 on city directories and on the 1911 FIP. It is noted that this laundry service was typically hand-laundry and not likely dry cleaning; in addition, PCE was not being readily used in dry cleaning until the 1930s.	101 Quebec Street	Offsite	NO	Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP, CDL
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	44	Historical Automotive Repair - a garage is identified at 169 Woolwich Street on the 1929 FIP, with an 'Auto Ignition and Battery Service' under construction on the 1946 FIP.	173 Woolwich Street	Offsite	NO	Hydraulically downgradient of the Phase One Property	FIP
	Gasoline and Associated Products Storage in Fixed Tanks	45	Historical Gasoline Service Station - a refueling and auto service station with 4 associated USTs is identified on the 1929 and 1946 FIPs at the southwest corner of Woolwich and Suffolk Streets. City directories indicate service stations (White Rose Service Station, Can Oil Co's Ltd. Service Station and Daley's Tire Shop Ltd & Service Station) present up to 1980.	192 Woolwich Street	Offsite	NO	Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP, CDL
37	Operation of Dry Cleaning Equipment (where chemicals are used)	46	Dry Cleaning Operations - Dry cleaning operation (4 Raza Inc, Parkers Cleaners, Daniel's Dry Cleaners Ltd.) have been located at 22 Suffolk Street East from 1986 to present based on city directories and MECP waste generator records.	22 Suffolk Street	Offsite	NO	Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	CDL, ELE
	Gasoline and Associated Products Storage in Fixed Tanks	47	Historical UST - the CFOT/FST database (ERIS) indicated that a 500 L fuel oil UST (single-wall steel) was installed at 21 Paisley Street in 2005 for Crewgall Properties. A furnace oil spill was reported in 2005 with soil contamination (amount not reported). The tank was delisted in 2013.	21 Paisley Street	Offsite	NO	Hydraulically upgradient/ transgradient, but distance is greater than 100 m from the Phase One Property	ELE
	Ink Manufacturing, Processing and Bulk Storage	48	Historical Printing Operation - Leaman Printing Co., a historical printing operation was listed in the city directories at 54 Cork Street East, from 1939 until 1944	50 Cork Street East	Offsite	NO	Hydraulically transgradient, and distance is greater than 50 m from the Phase One Property	CDL
28	Gasoline and Associated Products Storage in Fixed Tanks	49	Historical UST - the CFOT database indicated that a 5,072-L fibreglass reinforced plastic single-wall fuel oil UST was installed at 20 Cork Street East in 1986 for Bell Canada.	20 Cork Street East	Offsite	NO	Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	ELE
31	Ink Manufacturing, Processing and Bulk Storage	54	Historical Printing Operation - a historical printing operation was reported at 90 Woolwich Street in the Pinchin Phase One from the 1946 FIP; however Jacobs reviewed this FIP and did not see any noted operations at this address, and therefore this PCA is noted to be removed.	90 Woolwich Street	Offsite	NO	PCA removed, was not found on source material as reported.

28	Gasoline and Associated Products Storage in Fixed Tanks	85	Historical Service Station - A service station with 5 associated gasoline USTs is identified at the southeast corner of Norfolk and Woolwich Streets (234 Woolwich) on the 1929 FIP. The 1946 FIP shows 4 gasoline USTs.	Norfolk and Woolwich	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	86	Historical Garage - a garage is identified at 228 Woolwich Street on the 1929 and 1946 FIP	228 Woolwich	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
54	Textile Manufacturing and Processing	87	Textile manufacturing - a former textile manufacturer (Buy the Yard) was identified for 214 Woolwich Street based on ERIS Scott's Manufacturing records in 1989.	214 Woolwich Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	ELE
54	Textile Manufacturing and Processing	88	Historical Textile Factory - Royal Knitting Co. is located at 37 - 41 Norwich Street East on the 1911, 1916 and 1929 FIPs, with buildings including factory, storage, stock, dye house.	37-47 Norwich Street East	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
59	Wood Treating and Preservative Facility and Bulk Storage of Treated and Preserved Wood Products	89	Historical Varnishing Operations - a building labeled 'Varnishing' is identified at the corner of Norwich Street East and Cardigan Street on the 1911 FIP.	Norwich Street East and Cardigan Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
39	Paints Manufacturing, Processing and Bulk Storage	90	Historical Paint Shop - a paint shop is identified at the corner of Norwich Street East and Cardigan Street on the 1911 FIP.	Norwich Street East and Cardigan Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
57	Vehicles and Associated Parts Manufacturing	91	Vehicle parts manufacturer - a former motor vehicle brakes manufacturer (ABS Friction Corp.) was identified at 199 Woolwich Street based on an ERIS Scott's Manufacturing record for 1996.	199 Woolwich St.	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	ELE
46	Rail Yards, Tracks and Spurs	92	Railway Tracks - Canadian Pacific Railway lines are shown on the west/south side of Speed River. The lines have existed since at least 1908 and are present today.	West/South of Speed River	Offsite	NO		Hydraulically downgradient of the Phase One Property	FIP
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	93	Historical Garage - Royal City Garage is identified on Eramosa Street on the 1916 FIP	Eramosa Street	Offsite	NO		Hydraulically downgradient of the Phase One Property	FIP
57	Vehicles and Associated Parts Manufacturing	94	Historical Industrial Operations - a blacksmith and carriage shop is indicated on the 1892, 1911 and 1916 FIPs at 135-143 Woolwich Street	135-143 Woolwich Street	Offsite	NO		Hydraulically downgradient of the Phase One Property	FIP
34	Metal Fabrication	95	Historical Wire Manufacturing - Wire Tape Manufacturers (National Standard Co. of Canada Limited) are identified on the 1929 to 1960 FIPs at 133 Woolwich Street, with buildings/operations extending behind and to the north of the neighbouring properties.	133 Woolwich Street	Offsite	NO		Hydraulically downgradient of the Phase One Property	FIP
39	Paints Manufacturing, Processing and Bulk Storage	96	Historical Paint Shop - a paint shop is indicated on the 1916 FIP at 127 Woolwich Street; possibly associated with the carriage factory.	127 Woolwich Street	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP
57	Vehicles and Associated Parts Manufacturing	97	Historical Carriage, Motorbody and Farm Equipment Manufacturing - Carriage Factory (C. Kloepfer) is indicated on the 1911/1916 FIPs, and Commercial Motor Bodies & Carriages on the 1929 FIP at 121-133 Woolwich. Buildings include woodworking, storage, trimming, shipping, coal shed, blacksmith. On the 1946 FIP W.G. Wood Co. Ltd is identified for manufacturing of farm equipment.	121-133 Woolwich Street	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP
31	Ink Manufacturing, Processing and Bulk Storage	98	Historical Printing Operation - former book publishing operations (Ampersand Printing, ID Magazine, Ribbon Encore Inc.) were identified at 123 Woolwich Street from between 1986 through 2008 based on ERIS waste generator records.	123 Woolwich Street	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	ELE

28	Gasoline and Associated Products Storage in Fixed Tanks	100	Historical UST - Two USTs were identified on the 1929 FIP at 98 Quebec Street in front of a building labeled garage.	98 Quebec Street	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP
31	Ink Manufacturing, Processing and Bulk Storage	101	Historical Printing Operation - a newspaper publisher (Echo Weekly) was identified at 55 Wyndham Street North (Suite T 19B) based on ERIS Scott's Manufacturing records, indicating an established date of 1997.	55 Wyndham Street North	Offsite	No		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	ELE
57	Vehicles and Associated Parts Manufacturing	102	Historical Carriage Goods Manufacturing - Guelph Carriage Goods Co. (1892 FIP), Penfolds Carriage Factory (1892, 1897 and 1911 FIPs) and J. B. Armstrong Mfg. Co. Ltd, (1897 and 1911 FIPs) were located in what was referred to as the "Armstrong Block", between Quebec and Macdonell Streets. The operations included a spring shop, machine shop, woodworking, storage, blacksmith, warehouse.	between Quebec and Macdonell Streets	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	103	Historical Garage - a building labeled 'Garage' was identified on the 1929 FIP at 82-84 Macdonell Street.	82-84 Macdonell Street	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP
31	Ink Manufacturing, Processing and Bulk Storage	104	Historical Printing Operation - a former printing operation (Kwik Kopy Printing) was identified at 27 Wyndham Street based on ERIS Scott's Manufacturing records (established 1984).	27 Wyndham St N	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	ELE
28	Gasoline and Associated Products Storage in Fixed Tanks	105	Historical UST - a UST was identified on the 1929 FIP at 84 Macdonell Street, in front of a building labeled garage.	84 Macdonell Street	Offsite	NO		Hydraulically transgradient/ downgradient, and distance is greater than 100 m from the Phase One Property	FIP
39	Paints Manufacturing, Processing and Bulk Storage	106	Former Paint Shop - Paint shop located on 17 Quebec Street (1911 FIP).	17 Quebec Street	Offsite	NO		Based on site-specific groundwater flow, this location is hydraulically transgradient from the Phase One Property. Distance is greater than 50 m from the Phase One Property	FIP
39	Paints Manufacturing, Processing and Bulk Storage	107	Historical Painting Storage - A building labeled "Paints" was identified on the 1911 and 1916 FIPs at 29 Quebec Street	29 Quebec Street	Offsite	NO		Based on site-specific groundwater flow, this location is hydraulically transgradient from the Phase One Property. Distance is greater than 50 m from the Phase One Property	FIP
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	108	Historical l Automotive Repair - a building labeled "Garage" and "National Automotive Implements" is present on the 1929 and 1946 FIPs, respectively, at 40 Cork Street East.	40 Cork Street East	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
37	Operation of Dry Cleaning Equipment (where chemicals are used)	109	Historical Potential Dry Cleaning - 'Cleaning & Pressing' identified on the 1911 FIP at 44 Cork Street East	44 Cork Street East	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
31	Ink Manufacturing, Processing and Bulk Storage	110	Historical Printing Operation- a former printing business (The Printery) was identified at 46 Cork Street East (Unit 1), established in1990 based on ERIS Scott's Manufacturing records.	46 Cork Street East	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	ELE
31	Ink Manufacturing, Processing and Bulk Storage	111	Historical Printing Operation - a former printing operation (Justified Type) was identified at 19 Cork Street East in 1987 based on ERIS Scott's Manufacturing records and waste generator records for 2005 to 2012.	19 Cork Street East	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	ELE
34	Metal Fabrication	112	Historical Blacksmith - Blacksmith identified at 39-41 Cork Street East on the 1911 and 1916 FIP	39-41 Cork Street East	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP

Table 4-2. Potentially Contaminating Activities

55 Baker Street, 152 and 160 Wyndham Street North, and Park Lane, Guelph Ontario

		PCA		Property					
Potentia	ally Contaminating Activity (PCA)	Unique		Address / Location of		PCA results in	_	(n)	Information
(1)		ID	Descriptions of PCAs (in Phase One ESA Summary) (2)	PCA Onsite	PCA (3)	APEC	APEC	Rationale ⁽⁴⁾	Source
37	Operation of Dry Cleaning Equipment (where chemicals are used)	113	Historical Potential Dry Cleaning - 'Cleaning & Pressing' identified on the 1911 FIP at 45 Cork Street East	45 Cork Street East	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
31	Ink Manufacturing, Processing and Bulk Storage	114	Historical Printing Operations - a building labeled printing is identified on the 1911 to 1946 FIPs at 47 Cork Street East	47 Cork Street East	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
28	Gasoline and Associated Products Storage in Fixed Tanks	115	Historical UST - a UST was identified at 34 Wyndham Street North based on ERIS spill report of a leak in 1991 due to corrosion where a reported 450 L of hydraulic oil was released to soil and groundwater.	34 Wyndham Street North	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	ELE
37	Operation of Dry Cleaning Equipment (where chemicals are used)	116	Historical Potential Dry Cleaning - 'Chinese Laundry' identified on the 1911 and 1916 FIPs at 36 Macdonell Street, and on the 1929 and 1946 FIPs at 30 1/2 Macdonell Street	36 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
28	Gasoline and Associated Products Storage in Fixed Tanks	117	Historical USTs - four USTs are identified in front of 20-26 Macdonell Street on the 1929 and the two west USTs remain on the 1946 FIP.	20-26 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
34	Metal Fabrication	118	Historical Blacksmith - Blacksmith identified at 131 Macdonell Street on the 1911 and 1916 FIP	131 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	119	Historical l Automotive Repair - a series of buildings labeled 'Garage/Repair Shop', 'AutoBody Repairs' are present on the 1929 FIPs at 6-16 Macdonell Street. The 1946 FIP shows the operations with a reduced footprint of just 6-10 Macdonell Street.	6-16 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
31	Ink Manufacturing, Processing and Bulk Storage	120	Historical Printers - The Thompson Co. Ltd. Guelph Daily Mercury was located at 8-14 Macdonell Street as identified on the 1960 FIP. The ERIS report identified Scott's Manufacturing and waste generator records from 1989 to 2014 for paint, pigments, coatings, aromatic solvents, waste oils, and photo processing wastes. In 2002, a spill of 100 Gallons of soy based ink related to a fire was identified based on ERIS spill records.	8-14 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP, ELE
28	Gasoline and Associated Products Storage in Fixed Tanks	121	Historical USTs - four USTs are identified in front of 6-10 Macdonell Street (Garage) on the 1929 and 1946 FIPs.	6-10 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
37	Operation of Dry Cleaning Equipment (where chemicals are used)	122	Historical Potential Dry Cleaning - 'Chinese Laundry' identified on the 1911 and 1916 FIPs at 8 Carden Street.	8 Carden Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
37	Operation of Dry Cleaning Equipment (where chemicals are used)	123	Potential Historical Dry Cleaning - 'Cleaner & Presser' identified on the 1946 FIP at 21 Macdonell Street	21 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
Other	Activity not defined in O. Reg. 153/04 Table 2 of Schedule D	124	Historical Coal Shed - a coal shed is identified on the 1911, 1916 and 1929 FIPs at 18-20 Carden, extending to Macdonell Street.	18-20 Carden	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
37	Operation of Dry Cleaning Equipment (where chemicals are used)	125	Historical Potential Dry Cleaning - Master Cleaners is identified on the 1960 FIP at 18-22 Carden Street	18-22 Carden Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
34	Metal Fabrication	126	Historical Tinsmith - Tinsmith/Tin Shop indicated on the 1911 to 1946 FIP at 31 Macdonell Street	31 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP
10	Commercial Autobody Shops	127	Historical Autobody Shop - Pruss Bros. Body & Fender Works were identified at 37 Macdonell Street on the 1946 FIP	37 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 100 m from the Phase One Property	FIP

Table 4-2. Potentially Contaminating Activities

55 Baker Street, 152 and 160 Wyndham Street North, and Park Lane, Guelph Ontario

Potenti	ially Contaminating Activity (PCA)	PCA Unique ID	Descriptions of PCAs (in Phase One ESA Summary) (2)	Property Address / Location of PCA Onsite	Location of PCA (3)	PCA results in APEC	Resulting APEC	Rationale ⁽⁴⁾	Information Source
Other	Activity not defined in O. Reg. 153/04 Table 2 of Schedule D		Spill - A spill of 200-300 L of anti-freeze to the road an catch basin at 55 Macdonell Street in 2015 was identified based on ERIS spill records.	55 Macdonell Street	Offsite	NO		Hydraulically transgradient, and distance is greater than 200 m from the Phase One Property	ELE
Other	Activity not defined in O. Reg. 153/04 Table 2 of Schedule D	129	Historical Coal Shed - A coal shed is shown beside the Canadian Pacific Railway lines on the 1911 to 1946 FIPs	Between Cardigan Street and the Rail Lines	Offsite	NO		Hydraulically transgradient/ downgradient to the Phase One Property	FIP

Notes

APEC = Area of Potential Environmental Concern

AST = Aboveground storage tank

CDL = City Directory Listings

ELE = EcoLog ERIS Database Search

FIP = Fire insurance plan

HER = Historical Environmental Reports

ID = Identification

mbgs = metres below ground surface

MECP = Ontario Ministry of the Environment, Conservation and Parks

offsite = Within Phase One Study area, outside the Phase One Property

onsite = Phase One Property

PCA = Potentially contaminating activity

PCE = tetrachloroethylene

SR = site reconnaissance

UST = Underground storage tank

¹PCA – potentially contaminating activity (as defined by O.Reg. 153/04)

² PCAs 1 to 56 were identified in the Pinchin Phase One ESA (2018), and descriptions have been updated where applicable for clarity. Additional PCAs (57 and above) were identified by Jacobs.

³ Refer to Figure 8 and 9 for PCA locations.

⁴ Regional groundwater flow was inferred to be towards Speed River (north to north-east); site-specific groundwater flow was shown to be towards the north on the north portion of the Site, and to the east on the southern portion of the Site (based on the Phase Two ESA [Jacobs, 2020]). Some of the updgradient/downgradient terminology may have changed from the Pinchin (2018) report based on this updated interpretation.

Table 4-3. Areas of Potential Environmental Concern

55 Baker Street, 152 and 160 Wyndham Street North, and Park Lane, Guelph, Ontario

Area	s of Potential Environmental Concern ^a	Location of Area of Potential Environmental Concern on Phase One Property		Potentially Contaminating Activity ^b	Location of PCA (on-site or off-site) ^c	Contaminants of Potential Concern ^d	Media Potentially Impacted (Groundwater, soil and/or sediment)
APEC-1	Historical Industrial Property Use	55 Baker Street Park Lane	34	Metal Fabrication	Onsite	Metals, hydride-forming Metals, ORPs (Hg, CrVI, B- HWS, CN-, EC, SAR), PHCs, PAHs, VOCs, BTEX	Soil and Groundwate
APEC-2	Unknown/Poor Quality Fill Material	Entire Site	30	Importation of Fill Material of Unknown Quality	Onsite	Metals, hydride-forming Metals, ORPs (Hg, CrVI, B- HWS, CN-, EC, SAR), PHCs, PAHs, VOCs, BTEX	Soil and Groundwate
APEC-3	Historical Transformers	East-central portion of 55 Baker Street	55	Transformer Manufacturing, Processing and Use	Onsite	PHCs, BTEX, PCBs, PAHs	Soil
APEC-4	Use of Road Salts	Entire Site	48	Salt Manufacturing, Processing and Bulk Storage	Onsite	EC, SAR, sodium, chloride	Soil and Groundwate
APEC-5	Historical Dry Cleaning	North portion of 55 Baker Street	37	Operation of Dry Cleaning Equipment (where chemicals are used)	Offsite - North	VOCs	Groundwater
APEC-6	Historical Retail Fuel Outlet, Historical UST, Historical Automotive repair/servicing and Historical Iron Foundry	North portion of 55 Baker Street	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Offsite - North	Metals, hydride-forming Metals, ORPs (Hg, CrVI), PHCs, PAHs, VOCs, BTEX	Groundwater
			28	Gasoline and Associated Products Storage in Fixed Tanks			
			32	Iron and Steel Manufacturing and Processing			
APEC-7	Potential Historical Dry Cleaning	North portion of 55 Baker Street	37	Operation of Dry Cleaning Equipment (where chemicals are used)	Offsite - North	VOCs	Groundwater
APEC-8	Potential Historical Dry Cleaning, Historical Garage and Historical UST	Wyndham Street North and	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Offsite - Northeast	Metals, hydride-forming Metals, ORPs (Hg, CrVI), PHCs, PAHs, VOCs, BTEX	Groundwater
		northeast portion of 55 Baker Street	28	Gasoline and Associated Products Storage in Fixed Tanks			
			37	Operation of Dry Cleaning Equipment (where chemicals are used)			
APEC-9	Historical Fuel Oil UST	North portion of 55 Baker Street	28	Gasoline and Associated Products Storage in Fixed Tanks	Offsite - Northeast	PHCs, VOCs, BTEX, PAHs, Metals (Lead)	Groundwater
APEC-10	Historical Automotive Repair	Northeast portion of 55 Baker Street	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Offsite - Northeast	Metals, hydride-forming Metals, ORPs (Hg, CrVI), PHCs, PAHs, VOCs, BTEX	Groundwater
APEC-11	Historical Off-Site Industrial Operations, Historical UST and Historical Fuel Oil Tank	West-central portion of 55 Baker Street	34	Metal Fabrication	Offsite - West	Metals, hydride-forming Metals, ORPs (Hg, CrVI, B- HWS, CN-, EC, SAR), PHCs, PAHs, VOCs, BTEX	Groundwater
			28	Gasoline and Associated Products Storage in Fixed Tanks			
APEC-12	Historical Automotive Garage, Historical USTs and Historical Industrial Operations	West-central portion of 55 Baker Street	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Offsite - West	Metals, hydride-forming Metals, ORPs (Hg, CrVI, B- HWS, CN-, EC, SAR), PHCs, PAHs, VOCs, BTEX	Groundwater
			28	Gasoline and Associated Products Storage in Fixed Tanks	•		
			34	Metal Fabrication			
APEC-13	Historical Automotive Garage	South portion of 152 Wyndham Street North	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Offsite - East	Metals, hydride-forming Metals, ORPs (Hg, CrVI), PHCs, PAHs, VOCs, BTEX	Groundwater
APEC-14	Historical Gasoline Spill	Southwest corner of 55 Baker Street	Other	Activity not defined in O. Reg. 153/04 Table 2 of Schedule D	Offsite - South	PHCs, PAHs, VOCs (MTBE), BTEX	Groundwater
APEC-15	Historical Dry Cleaning	Southeast portion of Park Lane	37	Operation of Dry Cleaning Equipment (where chemicals are used)	Offsite - East	VOCs	Groundwater

Table 4-3. Areas of Potential Environmental Concern

55 Baker Street, 152 and 160 Wyndham Street North, and Park Lane, Guelph, Ontario

Area	is of Potential Environmental Concern ^a	Location of Area of Potential Environmental Concern on Phase One Property		Potentially Contaminating Activity ^b	Location of PCA (on-site or off-site) ^c	Contaminants of Potential Concern ^d	Media Potentially Impacted (Groundwater, soil and/or sediment)
APEC-16	Historical AST and UST	Southwest corner of 55 Baker Street	28	Gasoline and Associated Products Storage in Fixed Tanks	Offsite - South	PHCs, VOCs, BTEX, PAHs, Metals (Lead)	Groundwater
APEC-17	Historical Service Station, Historical Dry Cleaning Operation, Historical Automotive Repair, Historical Coah and Body Manufacturing, Historical Industrial Property Use	Baker Street	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles Gasoline and Associated Products Storage in Fixed Tanks	Offsite - Northwest	Metals, hydride-forming Metals, ORPs (Hg, CrVI, B- HWS, CN-, EC, SAR), PHCs, PAHs, VOCs, BTEX	Groundwater
			37 34 57	Operation of Dry Cleaning Equipment (where chemicals are used) Metal Fabrication Vehicles and Associated Parts Manufacturing			
APEC-18	Former Oil Shed	Southwest portion of 55 Baker Street	28	Gasoline and Associated Products Storage in Fixed Tanks	Onsite	Metals, hydride-forming Metals, ORPs (Hg, CrVI), PHCs, PAHs, VOCs, BTEX	Soil and Groundwater
APEC-19	Former Oil House	Western portion of 152 Wyndham Street North	28	Gasoline and Associated Products Storage in Fixed Tanks	Onsite	Metals, hydride-forming Metals, ORPs (Hg, CrVI), PHCs, PAHs, VOCs, BTEX	Soil and Groundwater
APEC-20	Former Coke Storage	Northeast portion of 55 Baker Street	Other	Activity not defined in O. Reg. 153/04 Table 2 of Schedule D	Onsite	Metals, hydride-forming Metals, ORPs (Hg, CrVI), PHCs, PAHs, VOCs, BTEX, ABNs	Soil and Groundwater
APEC-21	Former Garage	Northeast portion of 55 Baker Street	27	Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Onsite	Metals, hydride-forming Metals, ORPs (Hg, CrVI), PHCs, PAHs, VOCs, BTEX	Soil and Groundwater
APEC-22	Historical Dry Cleaning Operations, Historical UST and Former Coal Yard	Southwest portion of 55 Baker Street	28	Gasoline and Associated Products Storage in Fixed Tanks	Offsite	Metals, hydride-forming Metals, ORPs (Hg, CrVI), PHCs, PAHs, VOCs, BTEX	Groundwater
			37	Operation of Dry Cleaning Equipment (where chemicals are used)			
			Other	Activity not defined in O. Reg. 153/04 Table 2 of Schedule D			

Notes:

APECs 1 to 16 were identified in the Pinchin (2018) Phase One ESA. Additional PCAs were added to offsite APECs 6, 11 and 12 as part of the Phase One ESA Update (Jacobs 2021). APECs 17 to 22 were identified by Jacobs (2021).

ABN = Acid Base Neutrals

APEC = Area of Potential Environmental Concern

B-HWS = hot water soluble boron

BTEX = benzene, toluene, ethylbenzene and xylenes

CN- = cyanide

COPC = contaminant of potential concern

CrVI = hexavalent chromium
EC = electrical conductivity
Hg = mercury
MTBE = methyl tert-butyl ether
O. Reg. = Ontario Regulation
ORP = other regulated parameter

PAH = Polyaromatic Hydrocarbons
PCB = Polychlorinated biphenyl
PHC = Petroleum Hydrocarbons
SAR = sodium adsorption ratio
UST = underground storage tank
VOC = Volatile Organic Compounds

a- APEC means the area on, in, or under a Phase One Property where one or more contaminants are potentially present, as determined through the Phase One ESA, including through (a) identification of past or present uses on, in, or under the Phase One Property; and (b) identification of PCAs.

b PCA – potentially contaminating activity means a use or activity as set out in Column A of Table 2 of Schedule D of O. Reg. 153/04 that is occurring or has occurred in a Phase One study area.

^c "Onsite" refers to within the Phase One/Two Property; "Offsite" refers to the Phase One Study Area.

d. Contaminants of potential concern were identified using the Method Groups as identified in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act, March 9, 2004, amended as of July 1, 2011.

Notes:

As = arsenic EC = electrical conductivity

ABNs = acid base neutral compounds ERIS = environmental risk information services

APEC = area of potential environmental concern FIP = fire insurance plan GW = groundwater BH = borehole B-HWS = boron - hot water soluble Hg = mercury

BTEX = benzene, toluene, ethylbenzene, xylene

MECP = Ontario Ministry of Environment, Conservation and Parks CN- = cyanide Metals = Metals, hydride-forming metals

COC = contaminant of concern MW = monitoring well

CrVI = hexavalent chromium ORPs = Other Regulated Parameters PAHs = polyaromatic hydrocarbons

PCA = potentially contaminating activity

PCBs = polychlorinated biphenyls PHCs = petroleum hydrocarbons

SAR = sodium adsorption ratio

Sb = antimony

Se = selenium

UST = underground storage tank VOCs = volatile organic compounds

^a PCA – potentially contaminating activity means a use or activity as set out in Column A of Table 2 of Schedule D of O. Reg. 153/04 that is occurring or has occurred in a Phase One study area.

^b AP Method groups as defined in the "Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act" dated July 1, 2011.

^{*}Samples from 2008 were collected in accordance with O. Reg. 153/04, but are missing analysis of uranium, which was not regulated under the Regulation at the time of investigation. This data is considered valid for RSC purposes.

[&]quot;--" = no data for the specified media

^a MECP (2011) Table 2: Full Depth Generic Site Condition Standards in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, Ministry of the Environment. April 15.

Bold denote positive detection at or above reportable detection limit

Shading denotes detected results that exceeds the applicable standard

U = Analyte not detected

ug/L = microgram(s) per litre

ug/g = microgram per gram

mg/L = milligram(s) per litre mS/cm = millisiemen per centimeter

SAR = Sodiuim Absorption Ratio

ID = identification NV = no value available in applicable standards

-- = Analyte not analyzed

^a MECP (2011) Table 2: Full Depth Generic Site Condition Standards in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, Ministry of the Environment. April 15.

Bold denote positive detection at or above reportable detection limit

Shading denotes detected results that exceeds the applicable standard

U = Analyte not detected

ug/L = microgram(s) per litre

ug/g = microgram per gram

mg/L = milligram(s) per litre mS/cm = millisiemen per centimeter

SAR = Sodiuim Absorption Ratio

ID = identification

NV = no value available in applicable standards

-- = Analyte not analyzed

^a MECP (2011) Table 2: Full Depth Generic Site Condition Standards in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, Ministry of the Environment. April 15.

Bold denote positive detection at or above reportable detection limit

Shading denotes detected results that exceeds the applicable standard

U = Analyte not detected

ug/L = microgram(s) per litre

ug/g = microgram per gram mg/L = milligram(s) per litre

mS/cm = millisiemen per centimeter

SAR = Sodiuim Absorption Ratio

ID = identification

NV = no value available in applicable standards

-- = Analyte not analyzed

^a MECP (2011) Table 2: Full Depth Generic Site Condition Standards in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, Ministry of the Environment. April 15.

Bold denote positive detection at or above reportable detection limit

Shading denotes detected results that exceeds the applicable standard

U = Analyte not detected

ug/L = microgram(s) per litre

ug/g = microgram per gram mg/L = milligram(s) per litre

mS/cm = millisiemen per centimeter

SAR = Sodiuim Absorption Ratio

ID = identification NV = no value available in applicable standards

-- = Analyte not analyzed

^a MECP (2011) Table 2: Full Depth Generic Site Condition Standards in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, Ministry of the Environment. April 15.

Bold denote positive detection at or above reportable detection limit

Shading denotes detected results that exceeds the applicable standard

U = Analyte not detected

ug/L = microgram(s) per litre

ug/g = microgram per gram

mg/L = milligram(s) per litre mS/cm = millisiemen per centimeter

SAR = Sodiuim Absorption Ratio

ID = identification

NV = no value available in applicable standards

-- = Analyte not analyzed

^a MECP (2011) Table 2: Full Depth Generic Site Condition Standards in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, Ministry of the Environment. April 15.

Bold denote positive detection at or above reportable detection limit

Shading denotes detected results that exceeds the applicable standard

U = Analyte not detected

ug/L = microgram(s) per litre

ug/g = microgram per gram mg/L = milligram(s) per litre

mS/cm = millisiemen per centimeter

SAR = Sodiuim Absorption Ratio

ID = identification

NV = no value available in applicable standards

-- = Analyte not analyzed

Notes:

μg/g = microgram per gram

ABN - acid, base, and neutral compounds

BTEX = benzene, toluene, ethylbenzene, and xylenes

F = fraction

FD = field duplicate

mbgs = metres below ground surface mS/cm = milliSiemens per centimetre N = normal sample

ORP = other regulated parameters

PAH = polycyclic aromatic hydrocarbons

PCB = polychlorinated biphenyls

pg/g = picogram per gram

PHC = petroleum hydrocarbons

SAR = sodium adsorption ratio SDG = sample delivery group

VOC = volatile organic compounds

Notes:

Grey shaded parameters have been reviewed further. Refer to Table 6-7b.

Bold parameters are identified as COCs

--= no value or not applicable MECP = Ontario Ministry of the Environment, Conservation and Parks

> = greater than mS/cm = milliSiemen per centimetre

< = less than No. = number

μg/g = microgram per gram PAH = polycyclic aromatic hydrocarbons
ABN = acid, base, and neutral compounds PCB = polychlorinated biphenyl

COC = contaminant of concern PHC = petroleum hydrocarbon
F = fraction SCS = Site Condition Standard

Max = maximum concentration

MDL = method detection limit

OTR = Ontario Typical Range

a. The representative maximum concentration (the maximum concentration of similar analytes or total concentration of multiple isomers) is used for comparison.

^b. Column lists the greater of the maximum detected concentration and the maximum nondetect concentration.

^c Ontario Regulation 153/04, Table 2: Full Depth Generic Site Condition Standards in a Potale Ground Water Condition, for Residential/ Parkland/ Institutional Property Type Use and Coarse Textured Soils (MECP, 2011a).

d. For calcium, magnesium, and sodium, the Ontario Typical Ranges for an urban scenario are applied (MECP, 2011b)

Table 6-7b. Rationale for the Removal of Soil COCs

55 Baker Street, 152 and 160 Wyndham Street North, and Park Lane, Guelph, Ontario

Parameter				
Group	Parameter	Category	Sample(s)	Comment/Rationale
INORGANICS	Sodium	Parameter with no Table 2 SCS but	18 samples across the Site	18 of a total of 64 samples had detected concentrations greater than the
		detected concentrations above the	from 2019 and 2020.	OTR value of 216 µg/g. The remaining 46 samples had detected
		OTR value.		concentrations of sodium below the OTR value. Sodium risks are currently
				analyzed using SAR analysis. SAR results are discussed in Table 6-7c
				Based on the available information, at the discretion of the QPESA, sodium
				is not considered to be a COC for the Site.

Notes:

The rationale for exclusion of COCs listed in this table is based on the data collected as part of the ESA and only applies to this ESA.

µg/g = micrograms per gram QPESA = MECP Qualified Person for Environmental Site Assessment

COC = contaminant of concern SAR = sodium adsorption ratio
O. Reg. = Ontario Regulation SCS = Site Condition Standards

OTR = Ontario Typical Range

Table 6-7c. Rationale for the Exclusion of Soil COCs

55 Baker Street, 152 and 160 Wyndham Street North, and Park Lane, Guelph, Ontario

Parameter				
Group	Parameter	Category	Sample(s)	Comment/Rationale
РАН	Dibenzo[a,h]anthracene	Parameter with existing SCS and detected exceedance.	1 sample from BH-14 (0.8 to 1.4 mbgs) from 2008 (COA L712303).	One exceedances of dibenzo[a,h]anthracene was detected across the Phase Two Property from a historical sample at BH-14. In November 2019, BH208 was drilled in the same area as BH-14, and samples were collected between 0.91 to 1.07 mbgs, and 2.3 to 2.44 mbgs. The results from the two locations were averaged below the SCS.
				Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Phase Two Property.
INORGANICS	Conductivity (EC) Sodium Adsorption Ratio (SAR)	Parameter with Table 2 SCS and exemptions in Section 49.1 of O. Reg. 153/04	34 (EC) and 56 (SAR) samples across the Site from 2019 and 2020.	The presence of EC and SAR at the Site are related to the application of salt on the parking lot surface during winter conditions. The application of salt has been used for the safety of vehicular and pedestrian traffic. Under Section 49.1 of the revised O. Reg. 153/04, the SCS is deemed to not be exceeded for the purpose of Part XV.1 of the Act should a substance be applied to surfaces for hte safety of vehicularor pedestrian traffic under conditions of snow or ice or both. Therefore, at the discretion of the QPESA, EC and SAR were not considered to be COCs for the Phase Two Property.

Notes:

The rationale for exclusion of COCs listed in this table is based on the data collected as part of the ESA and only applies to this ESA.

μg/g = micrograms per gram O. Reg. = Ontario Regulation

COA = certificate of analysis PAH = polycyclic aromatic hydrocarbon

COC = contaminant of concern QPESA = MECP Qualified Person for Environmental Site Assessment

EC = electrical conductivity SAR = sodium adsorption ratio mbgs = metres below ground surface SCS = Site Condition Standards

^a MECP (2011) Table 2: Full Depth Generic Site Condition Standards in a Potable Ground Water Condition, residential/parkland/institutional land use, coarse soil texture.

Source: Ontario Ministry of the Environment, Parks and Conservation (MECP). 2011. Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, Ministry of the Environment. April 15.

Notes

Bold denote positive detection at or above reportable detection limit
Shading denotes detected results that exceeds the applicable standard
U = Analyte not detected
ug/L = microgram(s) per litre
ug/g = microgram per gram
mg/L = milligram(s) per litre
mS/cm = millisiemen per centimeter
SAR = Sodiuim Absorption Ratio
ID = identification
NV = no value available in applicable standards
--- = Analyte not analyzed

Notes:

μg/l = microgram per gram

ABN - acid, base, and neutral compounds

BTEX = benzene, toluene, ethylbenzene, and xylenes

F = fraction

FD = field duplicate

mbgs = metres below ground surface

mS/cm = milliSiemens per centimetre

N = normal sample

ORP = other regulated parameters

PAH = polycyclic aromatic hydrocarbons

PCB = polychlorinated biphenyls

PHC = petroleum hydrocarbons

SAR = sodium adsorption ratio

SDG = sample delivery group

VOC = volatile organic compounds

^{a.} The representative maximum concentration (the maximum concentration of similar analytes or total concentration of multiple isomers) is used for comparison.

Bold parameters are identified as COCs

Grey shaded parameters have been reviewed further. Refer to Table 6-10b.

Blue shaded parameters have been reviewed further as the concentrations greater than the SCS are likely due to introduced water. Refer to Table 6-10b.

-- = no value or not applicable MECP = Ontario Ministry of the Environment, Conservation and Parks

> = greater than No. = number

< = less than PAH = polycyclic aromatic hydrocarbon

μg/L = microgram(s) per litrePHC = petroleum hydrocarbonABN = acid base neutral compoundsSCS = Site Condition StandardBTEX = benzene, toluene, ethylbenzene, and xylenesVOC = volatile organic compound

COC = contaminant of concern

^{b.} Column lists the greater of the maximum detected concentration and the maximum nondetect concentration.

Notes:

Table 6-10b. Rationale for the Removal of Groundwater COCs

55 Baker Street, 152 and 160 Wyndham Street North, and Park Lane, Guelph, Ontario

Parameter				
Group	Parameter	Category	Sample(s)	Comment/Rationale
METALS	Antimony	Parameter with existing SCS but RL exceedances only	Three samples (MW100, MW102A, MW102B) had RL exceedances of the SCS in September 2019 (COA L2343122)	One sample collected from each location listed had RL exceedances for antimony in September 2019. All other samples collected on the Phase Two Property had nondetected concentrations of the parameter, with the exception of one sample (MW108) that had detected concentrations of antimony, approximatlely an order-of-magnitude less than the SCS. Laboratory reports indicated that these detection limits were adjusted as the samples required dilution due to high concentrations of other target analytes (in this case, assumed to be sodium and chloride).
				Based on the available information, this parameter was determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, was not considered to be a COC for the Phase Two Property.
METALS	Beryllium Cobalt Silver	Parameters with existing SCS but RL exceedances only	Seven samples (MW100 x 2, MW102A x 2, MW102B x 2, MW110A) had RL exceedances of the SCS in September 2019 (COA L2343122) and December 2019 (COA L2399298).	Two samples collected from MW100, MW102A and MW102B, and one sample collected from MW110A had RL exceedances for each of the noted metals in September and December 2019. All other samples collected on the Phase Two Property had nondetected concentrations of the noted metals, with the exception of three samples (September and December 2019 at MW108 and December 2019 at MW103) that had detected concentrations of cobalt approximatlely 2.5 times less than the SCS. Laboratory reports indicated that these detection limits were adjusted as the samples required dilution due to high concentrations of other target analytes (in this case, assumed to be sodium and chloride).
				Based on the available information, these parameters were determined to likely not be present at concentrations exceeding the SCS; therefore, at the discretion of the QPESA, were not considered to be COCs for the Phase Two Property.
METALS	Vanadium	Parameter with existing SCS but RL exceedances only	Eight samples (MW100 x 2, MW102A x 2, MW102B x 2, MW110A x 2) had RL exceedances of the SCS in September 2019 (COA L2343122) or November 2019 (COA L2387876), and December 2019 (COA L2399298).	Two samples collected from each location listed had RL exceedances for vanadium in September or November 2019, and December 2019. All other samples collected on the Phase Two Property had nondetected concentrations of the noted metal, with the exception of one sample (MW108) that had a detected concentration of vanadium approximatlely an order-of-magnitude less than the SCS. Laboratory reports indicated that these detection limits were adjusted as the samples required dilution due to high concentrations of other target analytes (in this case, assumed to be sodium and chloride).

Notes:

The rationale for exclusion of COCs listed in this table is based on the data collected as part of the ESA and only applies to this ESA.

 μ g/L = micrograms per gram RL = laboratory reporting limit

COA = certificate of analysis PCA = potentially contaminating activity

COC = contaminant of concern QPESA = MECP Qualified Person for Environmental Site Assessment

O. Reg. = Ontario Regulation SCS = Site Condition Standards

Table 6-10c. Rationale for the Exclusion of Groundwater COCs

55 Baker Street, 152 and 160 Wyndham Street North, and Park Lane, Guelph, Ontario

Parameter Group	Parameter	Category	Sample(s)	Comment/Rationale
INORGANICS	Chloride Sodium	Parameter associated with salt that has been applied to surfaces for the safety of vehicular or pedestrian traffic.	Nineteen chloride samples and eighteen sodium samples from across the Site.	The presence of sodium and chloride in groundwater at the Site are related to the application of salt on the parking lot surface during winter conditions. The application of salt has been used for the safety of vehicular and pedestrian traffic. Under Section 49.1 of the revised O. Reg. 153/04, the SCS is deemed to not be exceeded for the purpose of Part XV.1 of the Act should a substance be applied to surfaces for hte safety of vehicularor pedestrian traffic under conditions of snow or ice or both. Therefore, at the discretion of the QPESA, sodium and chloride were not considered to be COCs for the Phase Two Property.
VOC	Chloroform	Parameter with "introduced" exceedance; exemptions in Section 49.1 of O. Reg. 153/04	Twelve samples (MW101 x 3, MW104, MW105, MW107 x 4, MW113 x 3) had a detected exceedance of the SCS from September and/or December 2019, or April 2020.	The initial groundwater samples collected in early September 2019 from each location listed (or April 2020 for MW113) after drilling/bedrock coring, purging, and well development had concentrations of chloroform ranging from 3.2 μg/L to 12 μg/L, greater than the SCS of 2.4 μg/L. The source of the chloroform exceedance was believed to be related to the municipal water that was used during the bedrock coring process. Jacobs has encountered a similar issue during a previous drilling program in the City of Guelph in 2018. For that project, two samples, one from the water truck and one from the water truck hose that was used during the coring activities, were analyzed for VOCs. All VOCs were non detect in the municipal water water samples apart from bromodichloromethane (12.5 to 12.9 μg/L), dibromochloromethane (11.5 to 11.8 μg/L), and chloroform (9.8 to 10.1 μg/L). These analytes are trihalomethanes that are typically present in municipally-treated water substantiating that municipal water introduced during drilling activities as the likely source of trihalomethanes in groundwater. For the current project, all VOCs were nondetect in groundwater apart from these same three analytes, and from one sample for 1,1-dichloroethane. Additional groundwater samples were collected in late September 2019 and December 2019 from the two locations with the highest reported chloroform concentrations (MW101 and MW107). Slightly lower concentrations of chloroform were detected in the second set of samples and in the third set of samples. MW113 was installed in April 2020, and three samples have been collected (two normal and one field duplicate) with concentrations of chloroform ranging from 3.2 to 4.4 μg/L. Based on the available information, the QPESA determined there was a discharge of drinking water (within the meaning of the Safe Drinking Water Act, 2002), resulting in chloroform exceeding the SCS. Under Section 49.1 of the revised O. Reg. 153/O4, the SCS is deemed to not be exceeded for the purpose of Part XV.1 of the Act.

Notes:

The rationale for exclusion of COCs listed in this table is based on the data collected as part of the ESA and only applies to this ESA.

μg/L = micrograms per gram PCA = potentially contaminating activity

COC = contaminant of concern QPESA = MECP Qualified Person for Environmental Site Assessment

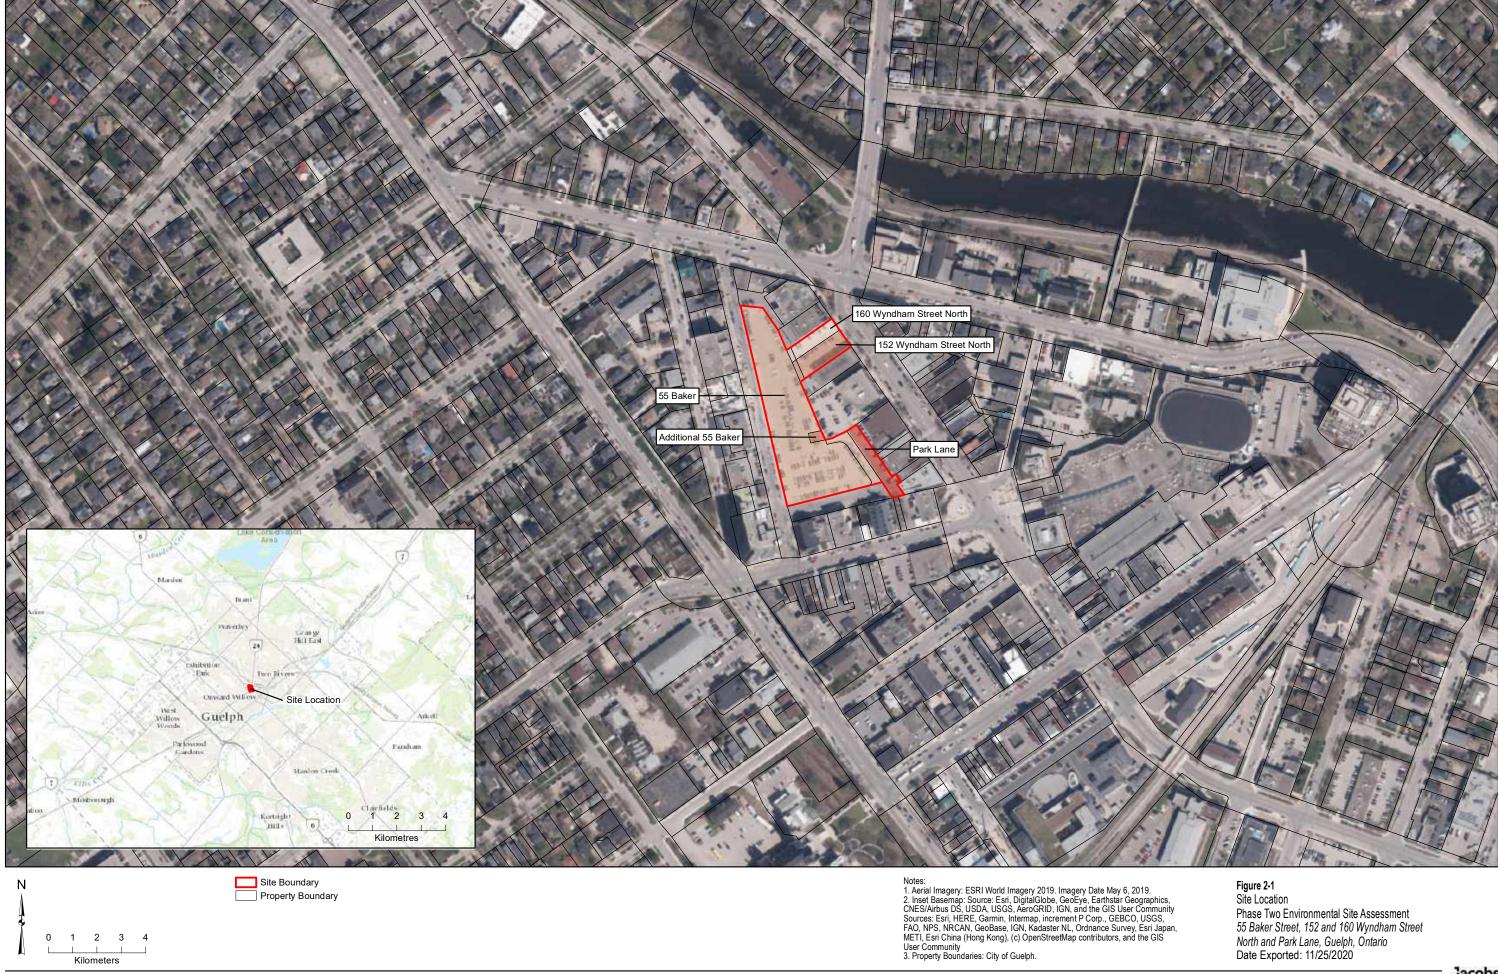

O. Reg. = Ontario Regulation SCS = Site Condition Standards
RL = laboratory reporting limit VOC = volatile organic compound

Appendix B Sampling and Analysis Plan

Table B-1. Sampling and Analysis Plan - July to August, 2019

55 Baker Street, 152 and 160 Wyndham Street North, Chapel Lane, and Park Lane, Guelph, Ontario

						Phase Tv	vo Envi	ronmei	ntal Site	e Assessm	ent	
Boring ID	Type of Location	Media	Number of Locations	Approximate Depth (mbgs)	Metals (O.Reg. 153/04)	Inorganics (Free Cyanide, pH, EC and SAR)	PHCs F1-F4 incl. BTEX	PHCs F2-F4	РАНѕ	VOCs	ABNs	Purpose and Justification Field Instructions
BH200	new	soil	1	4.8	3	3	3		3	3 2		To characterize overburden soil for metals, inorganics, PHCs, PAHs and PCBs based on presence of former transformer station, former industrial property use, unknown poor quality fill and suspected clean sample for analysis, sample from bottom of borehole to be submitted on hold. PCB samples to be collected 0-0.3 and 0.3 to 0.6 mbgs, submit deeper sample on hold. HSA to top of bedrock, confirm bedrock with SS.
BH201	new	soil	1	7.2	4	4	4		4	4		To characterize overburden soil for metals, inorganics, PHCs, PAHs, and VOCs based on presence of former industrial property use, unknown poor quality fill material and use of road salts (APEC#1, 2, 4). Collect 1 sample from each stratigraphic layer (worst case fill, suspected clean native [min. 0.5 m below impacts], silt [worst case or min. 0.5 m below impacts], silt [worst case or min. 0.5 m below impacts], silt [worst case or min. 0.5 m below impacts], silt [worst case or min. 0.5 m below impacts], sample from bottom of borehole to be submitted on hold. HSA to top of bedrock, confirm bedrock with SS. To characterize geotechnical conditions including soil characteristics, penetration tests, bearing capacity, and compression tests. Collect soil samples for geotechnical testing (including moisture, grain size, Attenberg limits and compression testing).
BH202	new	soil	1	5	3	3	3		3	3		To characterize overburden soil for metals, inorganics, PHCs, PAHs, and VOCs based on presence of former industrial property use, unknown poor quality fill material and use of road salts (APEC#1, 2, 4). Collect 1 sample from each stratigraphic layer (worst case fill, suspected clean native [min. 0.5 m below impacts] and bottom of bohehole [top of rock]) for all parameters, submit fill and suspected clean sample for analysis, sample from bottom of borehole to be submitted on hold. HSA to top of bedrock, confirm bedrock with SS.
BH203	new	soil	1	5	3	3	3		3	3		To characterize overburden soil for metals, inorganics, PHCs, PAHs, and VOCs based on presence of unknown poor quality fill material and use of road salts (APEC#2, 4). To characterize geotechnical conditions including soil characteristics, penetration tests, bearing capacity, and compression tests. Collect 1 sample from each stratigraphic layer (worst case fill, suspected clean native [min. 0.5 m below impacts] and bottom of bohehole [top of rock]) for all parameters, submit fill and suspected clean sample for analysis, sample from bottom of borehole to be submitted on hold. HSA to top of bedrock, confirm bedrock with SS. Collect soil samples for geotechnical testing (including moisture, grain size, Attenberg limits and compression testing).
BH204	new	soil	1	5	3	3	3		3	3		To characterize overburden soil for metals, inorganics, PHCs, PAHs, and VOCs based on presence of unknown poor quality fill material and use of road salts (APEC#2, 4). To characterize geotechnical conditions including soil characteristics, penetration tests, bearing capacity, and compression tests. Collect 1 sample from each stratigraphic layer (worst case fill, suspected clean native [min. 0.5 m below impacts] and bottom of bohehole [top of rock]) for all parameters, submit fill and suspected clean sample for analysis, sample from bottom of borehole to be submitted on hold (submit FOC). HSA to top of bedrock, confirm bedrock with SS. Collect soil samples for geotechnical testing (including moisture, grain size, Attenberg limits and compression testing).
BH205	new	soil	1	5	3	3	3		3	3		To characterize soil for metals, inorganics, PHCs, PAHs, and VOCs based on former industrial property use, unknown poor quality fill material and use of road salts (APEC#2, 4). Collect 1 sample from each stratigraphic layer (worst case fill, suspected clean native [min. 0.5 m below impacts] and bottom of bohehole [top of rock]) for all parameters, submit fill and suspected clean sample for analysis, sample from bottom of borehole to be submitted on hold. HSA to top of bedrock, confirm bedrock with SS.

Table B-2. Sampling and Analysis Plan - September to December 2019

55 Baker Street, 152 and 160 Wyndham Street North, Chapel Lane, and Park Lane, Guelph, Ontario

						Phase Tw	vo Environr	nental Site A	ssessm	ent		
Boring ID	Type of Location	Media	Number of Locations	Approximate Depth (mbgs)	Metals (O.Reg. 153/04)	Inorganics (Free Cyanide, pH, EC and SAR)	PHCs F1-F4 incl. BTEX	PAHS	VOCS	ABNS	Purpose and Justification	Field Instructions
ВН207	new	soil	1	2.5			3				Historical exceedance (XCG 2008) of PHC F3 and F4 at BH-10 from 0.0 - 0.60 mbgs. Confirm soil quality in engineered fill material from 0.0 to max 0.6 mgbs, and vertical delineation.	Sample engineered fill beneath asphalt from same depth as exceedance 0-0.6 mbgs, ensure no asphalt pieces. Collect 2nd sample from bottom of fill/below exceedance (previous boring terminated at 0.76 mbgs) from unimpacted fill, if present. If no field evidence of PHC impact in the fill, collect samples 1 and 2 regardless. Collect third sample from suspected clean native (min. 0.5 m below impacts). Submit first 2 samples for analysis and place 3rd sample on hold pending analysis of samples above.
BH208	new	soil	1	4.5				3			Vertical delineation of historical exceedance (XCG 2008) of PAHs at BH-14 from 0.8 - 1.4 mbgs.	Collect 1st sample from historical exceedance at approx. 1.0 mbgs. Collect 2nd fill sample below exceedance (previous boring terminated at 1.83 mbgs, possible concrete floor) from unimpacted fill, if present. Collect third sample from suspected clean native (min. 0.5 m below impacts). Submit 1st and 2nd sample for analysis, and place 3rd sample on hold pending analysis of sample above.
вн209	new	soil	1	3	3				17	2	Vertical and lateral delineation of Metals and PCBs at SA9 from surficial soil sample.	Sample upper fill for metals just below asphalt, second sample from lower fill (goes to 2.19 in adjacent BH200) and third from suspected clean native (min. 0.5 m below impacts) and place 3rd sample on hold pending analysis of sample above. Collect 3 samples for PCBs analysis, 1st from aggregate 0 to 0.1 mbgs, 2nd from upper 15 cm immediately beneath the aggregate fill material, and 3rd from a 15 cm interval chosen based on field observations, either located 30 cm beneath the 2nd sample, the bottom of the fill layer, or the top of the underlying native soil. Submit the 1st and 2nd sample for PCB analysis, submit the 3rd sample on hold pending analysis of samples above. ***See figure for sample collection locations - For PCB samples collect 3 additional sets at locations as per figure (BH209N, W, S) with same depths as detailed above, place all these samples on hold.
BH210	new	soil	1	3	3						Vertical delineation of historical exceedance (Kewen 2001) of Zinc at BH2 from 0.8 - 1.4 mbgs.	Previous boring has fill to 1.8 mbgs. Collect 1st sample from fill at approx. 1.0 mbgs to confirm historical datapoint, collect 2nd sample from bottom of fill material. at approx. 1.8 mbgs. Collect third sample from suspected clean native (min. 15 cm into the native soil and 0.5 m below impacts). Submit 1st and 2nd sample for analysis for metals, place 3rd sample on hold pending analysis of sample above.
BH211	new	soil	1	4.5	3						Vertical delineation of historical exceedance (XCG 2008) of lead at BH-6 from 3.1 - 3.7 mbgs.	Collect 1st sample from approximately 2.5 mbgs which is meant to be at least 0.5 metre above the historical datapoint; target the bottom of fill material. Collect 2nd sample from depth of previous exceedance in sand to confirm result. Collect 3rd sample from above bedrock 4.27 mbgs (XCG 2008). Submit the 2nd sample for analysis for metals, place 1st and 3rd samples on hold pending analysis of 2nd sample.

Boring ID	Type of Location	Media	Number of Locations	Approximate Depth (mbgs)	Metals (O.Reg. 153/04) Inorganics (Free Cyanide, pH, EC	PHCs F1-F4 incl. BTEX	PHCs F1-F4	PAHs	VOCs	PCBs	ABNs	Purpose and Justification Field Instructions
MW112	new	soil	1	5.6 (soil) 8.5 (bedrock)		4		4	4			NEED Direction from ARA on ability to daylight. Location in area of numerous underground and overhead utilities. Location of well is to be installed with 5 ft clearance from all. Two closest BH/MWs are MW106 and 107 show: asphalt, then fill to 0.91/2.21, coarse sand/sand&gravel (5.66/4.98), bedrock to depth, static water 7 and 6.5 mbgs (about 1.5m into bedrock both wells). Note, fine-grained silt overburden unit prevalent in north portion of site, not anticipated to occur. APEC sources are an offsite fuel oil AST in a basement, and gasoline spill; with sand/gravel fill not expecting any shallow soil/fill impact. With ARA clearances and potential need for daylighting to depth of utilities/fill, field assessment/sampling of upper overburden likely challenging. Need field opinion/evidence and documentation that no shallow fuel oil/gasoline in fill material. Discuss with office when in field as needed. If field evidence of fuel oil/gasoline in overburden, collect worst case sample where it occurs and discuss with PM before submitting for analysis. Otherwise collect 1 sample from each stratigraphic layer with the exception of the top 1.5m of fill (as stated above) from lower portion of fill material (if fill extends to 2+mbgs), suspected clean native (min. 0.5 m below impacts), silt if present (worst case or min. 0.5 m below transition or impacts from unit above), and bottom of bohehole (top of rock) for all parameters. Submit shallow native soil sample for analysis, sample from fill and bottom of borehole to be submitted on hold. HSA to top of bedrock, confirm bedrock with SS, HQ core thereafter to target depth. To characterize overburden soil and shallow groundwater for PHCs, PAHs, and VOCs based on presence of a former offsite fuel oil tank and a historical spill of gasoline in 2003 In bedrock, bentonite chip seal.
	w	groundwater		8.5		2		2	2			(APEC#14, 16). Closest boring MW106 shows: asphalt, fill to 0.91, coarse sand/sand & gravel to top of bedrock at 5.66, static water at ~7 mbgs. Within sand/gravel fill not expecting any shallow soil/fill impact. If field evidence of fuel oil/gasoline in overburden, collect worst case sample where it occurs and discuss with PM before submitting for analysis. Sample for PHCs, PAHs and VOCs at all sample intervals. If fill is less then 1.5 m and there is no evidence of fuleoil/gasoline impacts do not sample fill, if fill is greater then 1.5 m collect bottom of fill or depth of fuel oil/gasoline impacts if present. Collect second sample from suspected clean native (min. 0.5 m below impacts or fill above), if fuel oil/gasoline impacts present in native soil collect worst case, and third sample from suspected clean below (min. 0.5 m below impacts). Collect fouth sample from bottom of bothehole (top of rock) and submit on hold. Discuss with PM prior to lab submittal which samples to be placed on hold based off field evidence. HSA to top of bedrock, confirm bedrock with SS, HQ core thereafter to target depth. Place 3.05 m screen at bottom of corehole, if water bearing overbuden unit present discuss with PM prior to placement of screen in overburden soil, if not, core to target depth to screen water table, bentonite chip seal. Collect second GW sample at least 2 weeks after first sample to confirm results

Note:

APEC = area of potential concern

BTEX = benzene toluene ethylbenzene xylene

ID = Identification

PAHs = polycyclic aromatic hydtrocarbons

PHCs = petroleum hydrocarbons

Table B-4. Sampling and Analysis Plan - March 2020

55 Baker Street, 152 and 160 Wyndham Street North, Chapel Lane, and Park Lane, Guelph, Ontario

		,			Pha		nvironm essment		e	
Boring ID	Type of Location	Media	Number of Locations	Approximate Depth (mbgs)	Metals (O.Reg. 153/04)	Inorganics (Free Cyanide, pH, EC and SAR)	PHCs F1-F4	PAHs	Purpose and Justification	Field Instructions
ВН207і		soil		1.0			2		F1 PHCs were missing from the original BH207 to investigat the historical F2 and F3 PHC exceedances at BH-10 at 0-0.6 mbgs. Resample to collect full PHCs.	If ollect a PHC sample from below the asphalt, at an interval that will ensure absolutely no asphalt within the sample. First sample should be collected to a depth of 0,6 mbgs (i.e.).
MW113	new	soil	1	5.6 (soil) 8.5 (bedrock)	4	4	4	4	Change to RSC property line (south), additional well to replace MW106/MW112 for APEC characterization, delineation and groundwater flow at the new property boundary. Characterize overburden soil and shallow groundwater for PHCs, PAHs, and VOCs based on presence of a former offsite fuel oil tank and a historical spill of gasoline in 2003 (APEC#14, 16).	Location in area overhead utilities. Adjust location in field with appropriate clearance from all during private locates. No archaelogical clearance needed by ARA as in an area previously assessed (2006). Two closest BH/MWs (now off-Site) are MW106 and MW112; expect asphalt, then fill to 0.6/0.91, coarse sand/sand&gravel (5.5/4.98), bedrock to depth, static water 7 and 6.1 mbgs (about 1.5m into bedrock both wells). Note, fine-grained silt overburden unit prevalent in north portion of site, not anticipated to occur. APEC sources are an offsite fuel oil AST in a basement, and gasoline spill; with sand/gravel fill not expecting any shallow soil/fill impact. MW112 and MW106 did not see any related impacts. With previous ARA clearances (ie testpitting) stratigraphic units may mixed to the depth of the previous assessments (ranging from 1.0 to 1.6 m). Need field opinion/evidence and documentation that no shallow fuel oil/gasoline in fill material. Sample for Metals/Inorganics, PHCs, PAHs and VOCs at all sample intervals. If field evidence of fuel oil/gasoline in overburden, collect worst case sample where it occurs. Up to four soil samples to be collected: first sample from the "mixed" stratigraphic layer previously disturbed by ARA, estimated to be the top 1.5m of fill (as stated above), second from lower portion (undisturbed) fill material (if present or if fill extends to 2+mbgs), third from suspected clean native (min. 0.5 m below transition), and fourth from bottom of bohehole (top of rock). Submit first two depths of soil samples for analysis, sample from native and bottom of borehole to be submitted on hold. HSA to top of bedrock, confirm bedrock with SS, Air rotary to target depth.
		groundwater		8.5	2	2	2	2	2	Install 3.05 m screen at bottom of corehole, at a depth to straddle water table (6.1 and 7 mbgs in MW106/MW112), anticipate top of screen approximately coincident with top of bedrock, screen must be minimum of 1.25 metre above anticipated static water elevation, if water bearing overbuden unit present discuss with PM prior to placement of screen in overburden soil, if not, core to target depth to screen water table in bedrock, bentonite chip seal. Collect GW sample for Metals, PHCs, PAHs and VOCs. Collect second GW sample at least 5 days after first sample to confirm results.

April 15, 2020	Average	0.013	6.00E-06	0.1	8.07E-07	6.97E-02	25

K values from Table 6-3.

Notes:

 Δ = delta (change in)

 $i = (\Delta H/\Delta D)$

K = hydraulic conductivity

m/s = metre(s) per second

m/d = metre(s) per day

m/y = metre(s) per year

p = porosity

B-AVAIL-WT		Soil	Boron (B), Available		HW EXTR, EPA 6010B							

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

Hydrocarbon results are expressed on a dry weight basis.

Soil

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.

In samples where BTEX and F1 were analyzed, F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:

Hexavalent Chromium in Soil

CCME Total Hydrocarbons

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
- 3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
- 3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
- 4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

GLOSSARY OF REPORT TERMS

Surr - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds. The reported surrogate recovery value provides a measure of method efficiency. The Laboratory control limits are determined under column heading D.L.

mg/kg (units) - unit of concentration based on mass, parts per million mg/L (units) - unit of concentration based on volume, parts per million

< - Less than

D.L. - Detection Limit

N/A - Result not available. Refer to qualifier code and definition for explanation

Test results reported relate only to the samples as received by the laboratory. UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION. UNLESS OTHERWISE STATED, SAMPLES ARE NOT CORRECTED FOR CLIENT FIELD BLANKS.

Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.

ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.

ALS provides criteria information as a service to you, our customer. Every attempt is made to ensure the criteria information in this report is accurate and current, however, it is not guaranteed. ALS recommends review of the most current version of the regulation, and assumes no responsibility for the accuracy of the criteria levels indicated.

Legend:

Limit	99% Confidence Interval (Laboratory Control Limits)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
G	QC result did not meet ALS DQO. Refer to narrative comments for further information.
J	Duplicate results and limits are expressed in terms of absolute difference.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

B-AVAIL-WT		Soil	Boron (B), Available		HW EXTR, EPA 6010B				

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

Hydrocarbon results are expressed on a dry weight basis.

Soil

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.

In samples where BTEX and F1 were analyzed, F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:

Hexavalent Chromium in Soil

CCME Total Hydrocarbons

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
- 3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
- 3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
- 4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

GLOSSARY OF REPORT TERMS

Surr - A surrogate is an organic compound that is similar to the target analyte(s) in chemical composition and behavior but not normally detected in environmental samples. Prior to sample processing, samples are fortified with one or more surrogate compounds. The reported surrogate recovery value provides a measure of method efficiency. The Laboratory control limits are determined under column heading D.L.

mg/kg (units) - unit of concentration based on mass, parts per million mg/L (units) - unit of concentration based on volume, parts per million

< - Less than

D.L. - Detection Limit

N/A - Result not available. Refer to qualifier code and definition for explanation

Test results reported relate only to the samples as received by the laboratory. UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION. UNLESS OTHERWISE STATED, SAMPLES ARE NOT CORRECTED FOR CLIENT FIELD BLANKS.

Although test results are generated under strict QA/QC protocols, any unsigned test reports, faxes, or emails are considered preliminary.

ALS Laboratory Group has an extensive QA/QC program where all analytical data reported is analyzed using approved referenced procedures followed by checks and reviews by senior managers and quality assurance personnel. However, since the results are obtained from chemical measurements and thus cannot be guaranteed, ALS Laboratory Group assumes no liability for the use or interpretation of the results.

ALS provides criteria information as a service to you, our customer. Every attempt is made to ensure the criteria information in this report is accurate and current, however, it is not guaranteed. ALS recommends review of the most current version of the regulation, and assumes no responsibility for the accuracy of the criteria levels indicated.

Legend:

Limit	99% Confidence Interval (Laboratory Control Limits)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
G	QC result did not meet ALS DQO. Refer to narrative comments for further information.
J	Duplicate results and limits are expressed in terms of absolute difference.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Qualifiers for Individual Parameters Listed:

Qualifier	Description
[U]	The analyte was not detected above the EDL.
M,U	A peak has been manually integrated, and the analyte was not detected above the EDL.
[J]	The analyte was detected below the calibrated range but above the EDL.
SAR:M	Reported SAR represents a maximum value. Actual SAR may be lower if both Ca and Mg were detectable.
J,R	The analyte was detected below the calibrated range but above the EDL, and the ion abundance ratio(s) did not meet the acceptance criteria. Value is an estimated maximum.
J,B	The analyte was detected below the calibrated range but above the EDL, and was detected in the Method Blank at >10% of the sample concentration.
M,J,R	A peak has been manually integrated, the analyte was detected below the calibrated range but above the EDL, and the ion abundance ratio(s) did not meet the acceptance criteria. Value is

an estimated maximum.

M,J A peak has been manually integrated, and the analyte was detected below the calibrated range but above the EDL.

Methods Listed (if applicable):

ALS Test Code	Matrix	Test Description	Method Reference**
625-511-WT	Soil	ABN-O.Reg 153/04 (July 2011)	SW846 8270 (511)

Soil and sediment samples are dried by mixing with a desiccant prior to extraction. The extracts are dried, concentrated and exchanged into a solvent and analyzed by GC/MS. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

B-HWS-R511-WT Soil Boron-HWE-O.Reg 153/04 (July 2011) HW EXTR, EPA 6010B

A dried solid sample is extracted with calcium chloride, the sample undergoes a heating process. After cooling the sample is filtered and analyzed by ICP/OES.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-WAD-R511-WT Soil Cyanide (WAD)-O.Reg 153/04 (July MOE 3015/APHA 4500CN I-WAD

The sample is extracted with a strong base for 16 hours, and then filtrate is then distilled where the cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen

chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CR-CR6-IC-WT Soil Hexavalent Chromium in Soil SW846 3060A/7199

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Method 7199, published by the United States Environmental Protection Agency (EPA). The procedure involves analysis for chromium (VI) by ion chromatography using diphenylcarbazide in a sulphuric acid solution.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

DINITROTOL-CALC-WTSoilABN-Calculated ParametersSW846 8270DX-R511-HRMS-BUSoilDioxins and FuransUSEPA 1613BEC-WTSoilConductivity (EC)MOEE E3138

A representative subsample is tumbled with de-ionized (DI) water. The ratio of water to soil is 2:1 v/w. After tumbling the sample is then analyzed by a conductivity meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

F1-F4-511-CALC-WT Soil F1-F4 Hydrocarbon Calculated CCME CWS-PHC, Pub #1310, Dec 2001-S

Parameters

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

Hydrocarbon results are expressed on a dry weight basis.

L2318180 CONT'D....
Job Reference: CE751900.A.CS.EV 19 19-01
PAGE 29 of 31
27-AUG-19 15:51 (MT)

Methods Listed (if applicable):

ALS Test Code Matrix Test Description Method Reference**

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.

In samples where BTEX and F1 were analyzed, F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
- 3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
- 3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
- 4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-511-WT Soil F1-O.Reg 153/04 (July 2011) E3398/CCME TIER 1-HS

Fraction F1 is determined by extracting a soil or sediment sample as received with methanol, then analyzing by headspace-GC/FID.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

F2-F4-511-WT Soil F2-F4-O.Reg 153/04 (July 2011) CCME Tier 1

Petroleum Hydrocarbons (F2-F4 fractions) are extracted from soil with 1:1 hexane:acetone using a rotary extractor. Extracts are treated with silica gel to remove polar organic interferences. F2, F3, & F4 are analyzed by GC-FID. F4G-sq is analyzed gravimetrically.

Notes:

- 1. F2 (C10-C16): Sum of all hydrocarbons that elute between nC10 and nC16.
- 2. F3 (C16-C34): Sum of all hydrocarbons that elute between nC16 and nC34.
- 3. F4 (C34-C50): Sum of all hydrocarbons that elute between nC34 and nC50.
- 4. F4G: Gravimetric Heavy Hydrocarbons
- 5. F4G-sq: Gravimetric Heavy Hydrocarbons (F4G) after silica gel treatment.
- 6. Where both F4 (C34-C50) and F4G-sq are reported for a sample, the larger of the two values is used for comparison against the relevant CCME guideline for F4.
- 7. F4G-sq cannot be added to the C6 to C50 hydrocarbon results to obtain an estimate of total extractable hydrocarbons.
- 8. This method is validated for use.
- 9. Data from analysis of validation and quality control samples is available upon request.
- 10. Reported results are expressed as milligrams per dry kilogram, unless otherwise indicated.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

GRAIN SIZE-HYD-WT Soil Grain Size by Hydrometer ASTM D422-63

Particle size curve is generated from dry sieving (particles > 2 mm), wet sieving (particles 2 mm-75 um and hydrometer readings (particles < 75 um)

HG-200.2-CVAA-WT Soil Mercury in Soil by CVAAS EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MEHG-GCAF-VA Soil Methylmercury in Soil by GCAFS DeWild et al. (2004)

This method follows procedures published by DeWild, Olund, Olsen and Tate (2004) for the US Geological Survey (Techniques and Methods 5A-7). Samples are leached with an acidic copper sulphate solution to solubilize methylmercury for inorganic complexes. The methylmercury is then extracted into dichloromethane and then an aliquot is back extracted into ultra-pure water. The extract is analyzed by aqueous phase ethylation, purge and trap, desorption and GC separation. The separated species are then pyrolized to elemental Hg and quantified by cold vapour atomic flourescence spectroscopy. Results are reported "as MeHg".

MET-200.2-CCMS-WT Soil Metals in Soil by CRC ICPMS EPA 200.2/6020A (mod)

Soil/sediment is dried, disaggregated, and sieved (2 mm). For tests intended to support Ontario regulations, the <2mm fraction is ground to pass through a 0.355 mm sieve. Strong Acid Leachable Metals in the <2mm fraction are solubilized by heated digestion with nitric and hydrochloric acids. Instrumental analysis is by Collision / Reaction Cell ICPMS.

Limitations: This method is intended to liberate environmentally available metals. Silicate minerals are not solubilized. Some metals may be only partially recovered (matrix dependent), including AI, Ba, Be, Cr, S, Sr, Ti, TI, V, W, and Zr. Elemental Sulfur may be poorly recovered by this method. Volatile forms of sulfur (e.g. sulfide, H2S) may be excluded if lost during sampling, storage, or digestion.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

METHYLNAPS-CALC-WT Soil ABN-Calculated Parameters SW846 8270

MOISTURE-INT-SVOC-BU Solid % Moisture - Internal Use ASTM METHOD D2974-00

MOISTURE-VA Soil Moisture content CCME PHC in Soil - Tier 1 (mod)

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of two hours.

MOISTURE-WT Soil % Moisture CCME PHC in Soil - Tier 1 (mod)

PAH-511-WT Soil PAH-O.Reg 153/04 (July 2011) SW846 3510/8270

A representative sub-sample of soil is fortified with deuterium-labelled surrogates and a mechanical shaking technique used to extract the sample with a mixture of methanol and toluene. The extracts are concentrated and analyzed by GC/MS. Results for benzo(b) fluoranthene may include contributions from benzo(j)fluoranthene, if also present in the sample.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

PCB-511-WT Soil PCB-O.Reg 153/04 (July 2011) SW846 3510/8082

An aliquot of a solid sample is extracted with a solvent, extract is cleaned up and analyzed on the GC/MS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PH-WT Soil pH MOEE E3137A

A minimum 10g portion of the sample is extracted with 20mL of 0.01M calcium chloride solution by shaking for at least 30 minutes. The aqueous layer is separated from the soil and then analyzed using a pH meter and electrode.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

SAR-R511-WT Soil SAR-O.Reg 153/04 (July 2011) SW846 6010C

A dried, disaggregated solid sample is extracted with deionized water, the aqueous extract is separated from the solid, acidified and then analyzed using a ICP/OES. The concentrations of Na, Ca and Mg are reported as per CALA requirements for calculated parameters. These individual parameters are not for comparison to any guideline.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

TOC & FOC-O.Reg 153/04 (July 2011) CARTER 21.3.2

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

VOC-1,3-DCP-CALC-WT Soil Regulation 153 VOCs SW8260B/SW8270C

VOC-511-HS-WT Soil VOC-O.Reg 153/04 (July 2011) SW846 8260 (511)

Soil and sediment samples are extracted in methanol and analyzed by headspace-GC/MS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

XYLENES-SUM-CALC-WT Soil Sum of Xylene Isomer Concentrations CALCULATION

Total xylenes represents the sum of o-xylene and m&p-xylene.

**ALS test methods may incorporate modifications from specified reference methods to improve performance.

Chain of Custody Numbers:

17-20190726-1 17-20190726-2

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
BU	ALS ENVIRONMENTAL - BURLINGTON, ONTARIO, CANADA
VA	ALS ENVIRONMENTAL - VANCOLIVER BRITISH COLLIMBIA CANADA

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, fitness for a particular purpose, or non-infringement. ALS assumes no responsibility for errors or omissions in the information. Guideline limits are not adjusted for the hardness, pH or temperature of the sample (the most conservative values are used). Measurement uncertainty is not applied to test results prior to comparison with specified criteria values.

LCSD Laboratory Control Sample Duplicate

Qualifier	Description
Α	Method Blank exceeds ALS DQO. Refer to narrative comments for further information.
J	Duplicate results and limits are expressed in terms of absolute difference.
M,J	A peak has been manually integrated, and the analyte was detected below the calibrated range but above the EDL.
M,J,R	A peak has been manually integrated, the analyte was detected below the calibrated range but above the EDL, and the ion abundance ratio(s) did not meet the acceptance criteria. Value is an estimated maximum.
M,U	A peak has been manually integrated, and the analyte was not detected above the EDL.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.
[U]	The analyte was not detected above the EDL.

Hold Time Exceedances:

	Sample						
ALS Product Description	ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
Moisture content							
	12	26-JUL-19 12:30	13-AUG-19 11:00	14	18	days	EHT

Legend & Qualifier Definitions:

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes. Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2318180 were received on 26-JUL-19 17:05.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Methods Listed (if applicable):

ALS Test Code Matrix Test Description Method Reference**

BNA-TCLP-WT Waste BNAs for O. Reg 347 SW846 8270

Samples are leached according to TCLP protocol and then the aqueous leachate is extracted and the resulting extracts are analyzed on GC/MSD

CN-TCLP-WT Waste Cyanide for O. Reg 347 APHA 4500CN I

This analysis is carried out in accordance with the extraction procedure outlined in "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods Volume 1C" SW-846 EPA Method 1311, published by the United States Environmental Protection Agency (EPA). In summary, the sample is extracted at a 20:1 liquid to solids ratio for 16 to 20 hours using either extraction fluid #1 (glacial acetic acid, water and sodium hydroxide) or extraction fluid #2 (glacial acetic acid), depending on the pH of the original sample. The extract is then filtered through a 0.6 to 0.8 micron glass fiber filter. The extract is then analyzed using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

F-TCLP-WT Waste Fluoride (F) for O. Reg 347 EPA 300.1

This analysis is carried out in accordance with the extraction procedure outlined in "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods Volume 1C" SW-846 EPA Method 1311, published by the United States Environmental Protection Agency (EPA). In summary, the sample is extracted at a 20:1 liquid to solids ratio for 16 to 20 hours using either extraction fluid #1 (glacial acetic acid, water and sodium hydroxide) or extraction fluid #2 (glacial acetic acid), depending on the pH of the original sample. The extract is then filtered through a 0.6 to 0.8 micron glass fiber filter. The extract is then analyzed using procedures adapted from EPA 300.1 and is analyzed by Ion Chromatography with conductivity and/or UV detection.

HG-TCLP-WT Waste Mercury (CVAA) for O.Reg 347 EPA 1631E

This analysis is carried out in accordance with the extraction procedure outlined in "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods Volume 1C" SW-846 EPA Method 1311, published by the United States Environmental Protection Agency (EPA). In summary, the sample is extracted at a 20:1 liquid to solids ratio for 16 to 20 hours using either extraction fluid #1 (glacial acetic acid, water and sodium hydroxide) or extraction fluid #2 (glacial acetic acid), depending on the pH of the original sample. The extract is then filtered through a 0.6 to 0.8 micron glass fibre filter and analysed using atomic absorption spectrophotometry (EPA 1631E).

LEACH-TCLP-WT Waste Leachate Procedure for Reg 347 EPA 1311

Inorganic and Semi-Volatile Organic contaminants are leached from waste samples in strict accordance with US EPA Method 1311, "Toxicity Characteristic Leaching Procedure" (TCLP). Test results are reported in leachate concentration units (normally mg/L).

MET-TCLP-WT Waste O.Reg 347 TCLP Leachable Metals EPA 6020B

This analysis is carried out in accordance with the extraction procedure outlined in "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods Volume 1C" SW-846 EPA Method 1311, published by the United States Environmental Protection Agency (EPA). In summary, the sample is extracted at a 20:1 liquid to solids ratio for 16 to 20 hours using either extraction fluid #1 (glacial acetic acid, water and sodium hydroxide) or extraction fluid #2 (glacial acetic acid), depending on the pH of the original sample. The extract is then filtered through a 0.6 to 0.8 micron glass fibre filter. Instrumental analysis of the digested extract is by collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020B).

MOISTURE-WT Soil % Moisture CCME PHC in Soil - Tier 1 (mod)

N2N3-TCLP-WT Waste Nitrate/Nitrite-N for O. Reg 347 EPA 300.1

This analysis is carried out in accordance with the extraction procedure outlined in "Test Methods for Evaluating Solid Waste - Physical/Chemical Methods Volume 1C" SW-846 EPA Method 1311, published by the United States Environmental Protection Agency (EPA). In summary, the sample is extracted at a 20:1 liquid to solids ratio for 16 to 20 hours using either extraction fluid #1 (glacial acetic acid, water and sodium hydroxide) or extraction fluid #2 (glacial acetic acid), depending on the pH of the original sample. The extract is then filtered through a 0.6 to 0.8 micron glass fiber filter. The extract is then analyzed using procedures adapted from EPA 300.1 and is analyzed by Ion Chromatography with conductivity and/or UV detection.

PAH-TCLP-WT Waste PAH for O. Reg 347 SW846 8270 (PAH)

Samples are leached according to TCLP protocol and then the aqueous leachate is extracted and the resulting extracts are analyzed on GC/MSD. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

PCB-511-WT Soil PCB-O.Reg 153/04 (July 2011) SW846 3510/8082

07-AUG-19 12:29 (MT)

Methods Listed (if applicable):

ALS Test Code Matrix Test Description Method Reference**

An aliquot of a solid sample is extracted with a solvent, extract is cleaned up and analyzed on the GC/MS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PYR-TCLP-WT Waste Pyridine for O. Reg 347 SW846 8260D

Samples are leached according to TCLP protocol and then analyzed on GC/MSD

VOC-TCLP-WT Waste VOC for O. Reg 347 SW846 8260

A sample of waste is leached in a zero headspace extractor at 30–2 rpm for 18–2.0 hours with the appropriate leaching solution. After tumbling the leachate is analyzed directly by headspace technology, followed by GC/MS using internal standard quantitation.

**ALS test methods may incorporate modifications from specified reference methods to improve performance.

Chain of Custody Numbers:

17-31072019

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code Laboratory Location

WT ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, fitness for a particular purpose, or non-infringement. ALS assumes no responsibility for errors or omissions in the information. Guideline limits are not adjusted for the hardness, pH or temperature of the sample (the most conservative values are used). Measurement uncertainty is not applied to test results prior to comparison with specified criteria values.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Laboratory Control Sample	Dichlorodifluoromethane	LCS-L	L2320007-1, -2, -4

Sample Parameter Qualifier key listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
LCS-L	Lab Control Sample recovery was below ALS DQO. Reference Material and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
R	The ion abundance ratio(s) did not meet the acceptance criteria. Value is an estimated maximum.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**							
B-HWS-R511-WT	Soil	Boron-HWE-O.Reg 153/04 (July	HW EXTR, EPA 6010B							
		2011)								

A dried solid sample is extracted with calcium chloride, the sample undergoes a heating process. After cooling the sample is filtered and analyzed by ICP/OES.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-WAD-R511-WT Soil Cyanide (WAD)-O.Reg 153/04 (July MOE 3015/APHA 4500CN I-WAD 2011)

The sample is extracted with a strong base for 16 hours, and then filtered. The filtrate is then distilled where the cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CR-CR6-IC-WT Soil Hexavalent Chromium in Soil SW846 3060A/7199

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Method 7199, published by the United States Environmental Protection Agency (EPA). The procedure involves analysis for chromium (VI) by ion chromatography using diphenylcarbazide in a sulphuric acid solution.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

EC-WT Soil Conductivity (EC) MOEE E3138

A representative subsample is tumbled with de-ionized (DI) water. The ratio of water to soil is 2:1 v/w. After tumbling the sample is then analyzed by a conductivity meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

F1-F4-511-CALC-WT Soil F1-F4 Hydrocarbon Calculated CCME CWS-PHC, Pub #1310, Dec 2001-S Parameters

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

Hydrocarbon results are expressed on a dry weight basis.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.

In samples where BTEX and F1 were analyzed, F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
- 3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
- 3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.

Reference Information

L2320007 CONTD....
PAGE 12 of 13
Version: DRAFT RE

4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-511-WT Soil F1-O.Reg 153/04 (July 2011) E3398/CCME TIER 1-HS

Fraction F1 is determined by extracting a soil or sediment sample as received with methanol, then analyzing by headspace-GC/FID.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

F2-F4-511-WT Soil F2-F4-O.Reg 153/04 (July 2011) CCME Tier 1

Petroleum Hydrocarbons (F2-F4 fractions) are extracted from soil with 1:1 hexane:acetone using a rotary extractor. Extracts are treated with silica gel to remove polar organic interferences. F2, F3, & F4 are analyzed by GC-FID. F4G-sg is analyzed gravimetrically.

Notes:

- 1. F2 (C10-C16): Sum of all hydrocarbons that elute between nC10 and nC16.
- 2. F3 (C16-C34): Sum of all hydrocarbons that elute between nC16 and nC34.
- 3. F4 (C34-C50): Sum of all hydrocarbons that elute between nC34 and nC50.
- 4. F4G: Gravimetric Heavy Hydrocarbons
- 5. F4G-sg: Gravimetric Heavy Hydrocarbons (F4G) after silica gel treatment.
- 6. Where both F4 (C34-C50) and F4G-sg are reported for a sample, the larger of the two values is used for comparison against the relevant CCME guideline for F4.
- 7. F4G-sg cannot be added to the C6 to C50 hydrocarbon results to obtain an estimate of total extractable hydrocarbons.
- 8. This method is validated for use.
- 9. Data from analysis of validation and quality control samples is available upon request.
- 10. Reported results are expressed as milligrams per dry kilogram, unless otherwise indicated.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

F4G-ADD-511-WT Soil F4G SG-O.Reg 153/04 (July 2011) MOE DECPH-E3398/CCME TIER 1

F4G, gravimetric analysis, is determined if the chromatogram does not return to baseline at or before C50. A soil sample is extracted with a solvent mix, the solvent is evaporated and the weight of the residue is determined.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

HG-200.2-CVAA-WT Soil Mercury in Soil by CVAAS EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MEHG-GCAF-VA Soil Methylmercury in Soil by GCAFS DeWild et al. (2004)

This method follows procedures published by DeWild, Olund, Olsen and Tate (2004) for the US Geological Survey (Techniques and Methods 5A-7). Samples are leached with an acidic copper sulphate solution to solubilize methylmercury for inorganic complexes. The methylmercury is then extracted into dichloromethane and then an aliquot is back extracted into ultra-pure water. The extract is analyzed by aqueous phase ethylation, purge and trap, desorption and GC separation. The separated species are then pyrolized to elemental Hg and quantified by cold vapour atomic flourescence spectroscopy. Results are reported "as MeHg".

MET-200.2-CCMS-WT Soil Metals in Soil by CRC ICPMS EPA 200.2/6020A (mod)

Soil/sediment is dried, disaggregated, and sieved (2 mm). For tests intended to support Ontario regulations, the <2mm fraction is ground to pass through a 0.355 mm sieve. Strong Acid Leachable Metals in the <2mm fraction are solubilized by heated digestion with nitric and hydrochloric acids. Instrumental analysis is by Collision / Reaction Cell ICPMS.

Limitations: This method is intended to liberate environmentally available metals. Silicate minerals are not solubilized. Some metals may be only partially recovered (matrix dependent), including Al, Ba, Be, Cr, S, Sr, Ti, Tl, V, W, and Zr. Elemental Sulfur may be poorly recovered by this method. Volatile forms of sulfur (e.g. sulfide, H2S) may be excluded if lost during sampling, storage, or digestion.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

METHYLNAPS-CALC-WT Soil ABN-Calculated Parameters SW846 8270

MOISTURE-VA Soil Moisture content CCME PHC in Soil - Tier 1 (mod)

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of two hours.

MOISTURE-WT Soil % Moisture CCME PHC in Soil - Tier 1 (mod)

PAH-511-WT Soil PAH-O.Reg 153/04 (July 2011) SW846 3510/8270

A representative sub-sample of soil is fortified with deuterium-labelled surrogates and a mechanical shaking techniqueis used to extract the sample

Reference Information

PAGE 13 of 13
Version: DRAFT RE

with a mixture of methanol and toluene. The extracts are concentrated and analyzed by GC/MS. Results for benzo(b) fluoranthene may include contributions from benzo(j)fluoranthene, if also present in the sample.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

SAR-R511-WT Soil SAR-O.Reg 153/04 (July 2011) SW846 6010C

A dried, disaggregated solid sample is extracted with deionized water, the aqueous extract is separated from the solid, acidified and then analyzed using a ICP/OES. The concentrations of Na, Ca and Mg are reported as per CALA requirements for calculated parameters. These individual parameters are not for comparison to any guideline.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

TOC-R511-WT Soil TOC & FOC-O.Reg 153/04 (July CARTER 21.3.2

2011)

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental

Protection Act (July 1, 2011).

VOC-1,3-DCP-CALC-WT Soil Regulation 153 VOCs SW8260B/SW8270C

VOC-511-HS-WT Soil VOC-O.Reg 153/04 (July 2011) SW846 8260 (511)

Soil and sediment samples are extracted in methanol and analyzed by headspace-GC/MS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

XYLENES-SUM-CALC- Soil Sum of Xylene Isomer CALCULATION

VT Concentrations

Total xylenes represents the sum of o-xylene and m&p-xylene.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

17-20190731

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid weight of sample

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory. UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description	
LCS-L	Lab Control Sample recovery was below ALS DQO.	Reference Material and/or Matrix Spike results were acceptable.
	Non-detected sample results are considered reliable	Other results, if reported, have been qualified.
RPD-NA	Relative Percent Difference Not Available due to res	ult(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined data quality objectives to provide confidence in the accuracy of associated test results.

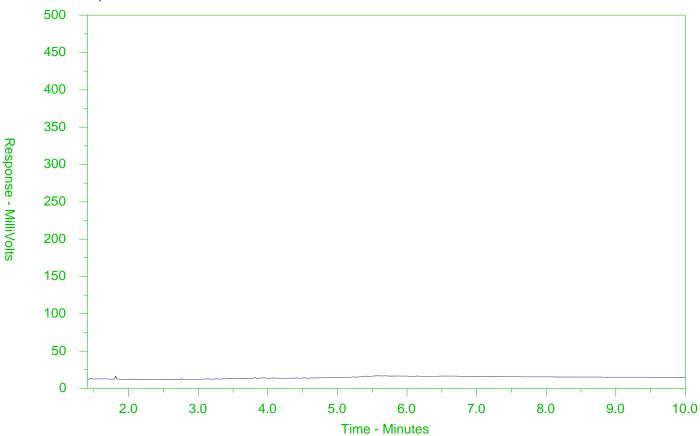

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

•	-Diesel/Jet	Fuels→		

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

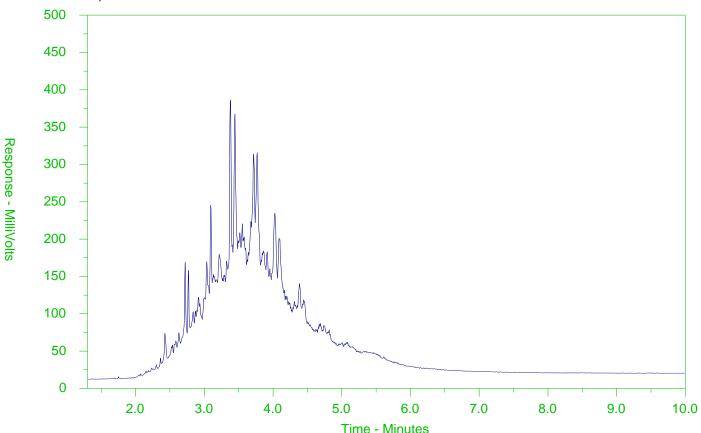

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

Qualifiers for Individual Parameters Listed:

Qualifier	Description
R	The ion abundance ratio(s) did not meet the acceptance criteria. Value is an estimated maximum.
SAR:M	Reported SAR represents a maximum value. Actual SAR may be lower if both Ca and Mg were detectable.
SAR:L	SAR is incalculable due to Ca and Mg below DL (with Na above DL). Lowest possible SAR is reported as minimum value.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).

Methods Listed (if applicable):

ALS Test Code	Matrix	Test Description	Method Reference**
625-511-WT	Soil	ABN-O.Reg 153/04 (July 2011)	SW846 8270 (511)

Soil and sediment samples are dried by mixing with a desiccant prior to extraction. The extracts are dried, concentrated and exchanged into a solvent and analyzed by GC/MS. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

B-HWS-R511-WT Soil Boron-HWE-O.Reg 153/04 (July 2011) HW EXTR, EPA 6010B

A dried solid sample is extracted with calcium chloride, the sample undergoes a heating process. After cooling the sample is filtered and analyzed by ICP/OES.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-WAD-R511-WT Soil Cyanide (WAD)-O.Reg 153/04 (July MOE 3015/APHA 4500CN I-WAD

The sample is extracted with a strong base for 16 hours, and then filtered. The filtrate is then distilled where the cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CR-CR6-IC-WT Soil Hexavalent Chromium in Soil SW846 3060A/7199

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Method 7199, published by the United States Environmental Protection Agency (EPA). The procedure involves analysis for chromium (VI) by ion chromatography using diphenylcarbazide in a sulphuric acid solution.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

DINITROTOL-CALC-WT Soil ABN-Calculated Parameters SW846 8270

EC-WT Soil Conductivity (EC) MOEE E3138

A representative subsample is tumbled with de-ionized (DI) water. The ratio of water to soil is 2:1 v/w. After tumbling the sample is then analyzed by a conductivity meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

F1-F4-511-CALC-WT Soil F1-F4 Hydrocarbon Calculated CCME CWS-PHC, Pub #1310, Dec 2001-S Parameters

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

Hydrocarbon results are expressed on a dry weight basis.

Methods Listed (if applicable):

ALS Test Code Matrix Test Description Method Reference**

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.

In samples where BTEX and F1 were analyzed, F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
- 3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
- 3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
- 4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-511-WT Soil F1-O.Reg 153/04 (July 2011) E3398/CCME TIER 1-HS

Fraction F1 is determined by extracting a soil or sediment sample as received with methanol, then analyzing by headspace-GC/FID.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

F2-F4-511-WT Soil F2-F4-O.Rea 153/04 (July 2011) CCME Tier 1

Petroleum Hydrocarbons (F2-F4 fractions) are extracted from soil with 1:1 hexane:acetone using a rotary extractor. Extracts are treated with silica gel to remove polar organic interferences. F2, F3, & F4 are analyzed by GC-FID. F4G-sq is analyzed gravimetrically.

Notes:

- 1. F2 (C10-C16): Sum of all hydrocarbons that elute between nC10 and nC16.
- 2. F3 (C16-C34): Sum of all hydrocarbons that elute between nC16 and nC34.
- 3. F4 (C34-C50): Sum of all hydrocarbons that elute between nC34 and nC50.
- 4. F4G: Gravimetric Heavy Hydrocarbons
- 5. F4G-sq: Gravimetric Heavy Hydrocarbons (F4G) after silica gel treatment.
- 6. Where both F4 (C34-C50) and F4G-sq are reported for a sample, the larger of the two values is used for comparison against the relevant CCME guideline for F4.
- 7. F4G-sq cannot be added to the C6 to C50 hydrocarbon results to obtain an estimate of total extractable hydrocarbons.
- 8. This method is validated for use.
- 9. Data from analysis of validation and quality control samples is available upon request.
- 10. Reported results are expressed as milligrams per dry kilogram, unless otherwise indicated.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

F4G-ADD-511-WT Soil F4G SG-O.Reg 153/04 (July 2011) MOE DECPH-E3398/CCME TIER 1

F4G, gravimetric analysis, is determined if the chromatogram does not return to baseline at or before C50. A soil sample is extracted with a solvent mix, the solvent is evaporated and the weight of the residue is determined.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

HG-200.2-CVAA-WT Soil Mercury in Soil by CVAAS EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MET-200.2-CCMS-WT Soil Metals in Soil by CRC ICPMS EPA 200.2/6020A (mod)

Soil/sediment is dried, disaggregated, and sieved (2 mm). For tests intended to support Ontario regulations, the <2mm fraction is ground to pass through a 0.355 mm sieve. Strong Acid Leachable Metals in the <2mm fraction are solubilized by heated digestion with nitric and hydrochloric acids. Instrumental analysis is by Collision / Reaction Cell ICPMS.

Limitations: This method is intended to liberate environmentally available metals. Silicate minerals are not solubilized. Some metals may be only partially recovered (matrix dependent), including Al, Ba, Be, Cr, S, Sr, Ti, Tl, V, W, and Zr. Elemental Sulfur may be poorly recovered by this method. Volatile forms of sulfur (e.g. sulfide, H2S) may be excluded if lost during sampling, storage, or digestion.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

METHYLNAPS-CALC-WT Soil ABN-Calculated Parameters SW846 8270

MOISTURE-WT Soil % Moisture CCME PHC in Soil - Tier 1 (mod)

PAH-511-WT Soil PAH-O.Reg 153/04 (July 2011) SW846 3510/8270

A representative sub-sample of soil is fortified with deuterium-labelled surrogates and a mechanical shaking technique used to extract the sample with a mixture of methanol and toluene. The extracts are concentrated and analyzed by GC/MS. Results for benzo(b) fluoranthene may include contributions from benzo(i)fluoranthene, if also present in the sample.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

PH-WT Soil pH MOEE E3137A

A minimum 10g portion of the sample is extracted with 20mL of 0.01M calcium chloride solution by shaking for at least 30 minutes. The aqueous layer is separated from the soil and then analyzed using a pH meter and electrode.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

SAR-R511-WT Soil SAR-O.Reg 153/04 (July 2011) SW846 6010C

A dried, disaggregated solid sample is extracted with deionized water, the aqueous extract is separated from the solid, acidified and then analyzed using a ICP/OES. The concentrations of Na, Ca and Mg are reported as per CALA requirements for calculated parameters. These individual parameters are not for comparison to any guideline.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory. UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, fitness for a particular purpose, or non-infringement. ALS assumes no responsibility for errors or omissions in the information. Guideline limits are not adjusted for the hardness, pH or temperature of the sample (the most conservative values are used). Measurement uncertainty is not applied to test results prior to comparison with specified criteria values.

IRM Internal Reference Material CRM Certified Reference Material CCV Continuing Calibration Verification CVS Calibration Verification Standard LCSD Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

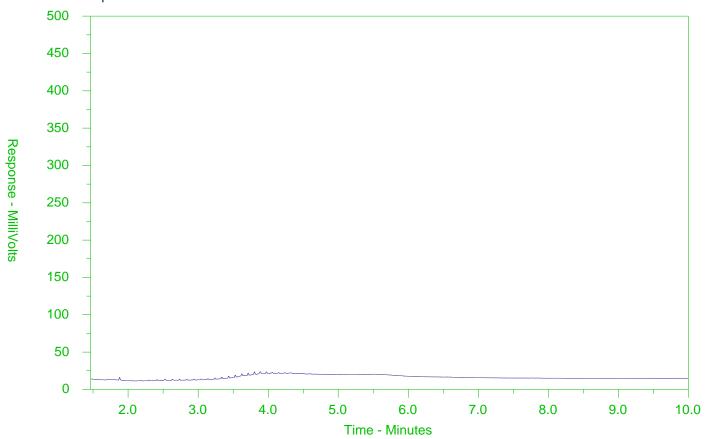

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Reference Information

Sample Parameter Qualifier key listed:

Qualifier Description

SAR:M Reported SAR represents a maximum value. Actual SAR may be lower if both Ca and Mg were detectable.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
B-HWS-R511-WT	Soil	Boron-HWE-O.Reg 153/04 (July 2011)	HW EXTR, EPA 6010B

A dried solid sample is extracted with calcium chloride, the sample undergoes a heating process. After cooling the sample is filtered and analyzed by ICP/OES.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-WAD-R511-WT Soil Cyanide (WAD)-O.Reg 153/04 (July MOE 3015/APHA 4500CN I-WAD 2011)

The sample is extracted with a strong base for 16 hours, and then filtered. The filtrate is then distilled where the cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CR-CR6-IC-WT Hexavalent Chromium in Soil SW846 3060A/7199

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Method 7199, published by the United States Environmental Protection Agency (EPA). The procedure involves analysis for chromium (VI) by ion chromatography using diphenylcarbazide in a sulphuric acid solution.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

EC-WT Soil Conductivity (EC) **MOEE E3138**

A representative subsample is tumbled with de-ionized (DI) water. The ratio of water to soil is 2:1 v/w. After tumbling the sample is then analyzed by a conductivity meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

F1-F4-511-CALC-WT Soil F1-F4 Hydrocarbon Calculated CCME CWS-PHC, Pub #1310, Dec 2001-S **Parameters**

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

Hydrocarbon results are expressed on a dry weight basis.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.

In samples where BTEX and F1 were analyzed, F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
- 3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
- 3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
- 4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-O.Reg 153/04 (July 2011) E3398/CCME TIER 1-HS

Fraction F1 is determined by extracting a soil or sediment sample as received with methanol, then analyzing by headspace-GC/FID.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

F2-F4-511-WT Soil F2-F4-O.Reg 153/04 (July 2011) **CCME Tier 1** L2330748 CONTD.... PAGE 26 of 27

Version: FINAL

Reference Information

Petroleum Hydrocarbons (F2-F4 fractions) are extracted from soil with 1:1 hexane:acetone using a rotary extractor. Extracts are treated with silica gel to remove polar organic interferences. F2, F3, & F4 are analyzed by GC-FID. F4G-sg is analyzed gravimetrically.

Notes

- 1. F2 (C10-C16): Sum of all hydrocarbons that elute between nC10 and nC16.
- 2. F3 (C16-C34): Sum of all hydrocarbons that elute between nC16 and nC34.
- 3. F4 (C34-C50): Sum of all hydrocarbons that elute between nC34 and nC50.
- 4. F4G: Gravimetric Heavy Hydrocarbons
- 5. F4G-sg: Gravimetric Heavy Hydrocarbons (F4G) after silica gel treatment.
- 6. Where both F4 (C34-C50) and F4G-sg are reported for a sample, the larger of the two values is used for comparison against the relevant CCME quideline for F4.
- 7. F4G-sq cannot be added to the C6 to C50 hydrocarbon results to obtain an estimate of total extractable hydrocarbons.
- 8. This method is validated for use.
- 9. Data from analysis of validation and quality control samples is available upon request.
- 10. Reported results are expressed as milligrams per dry kilogram, unless otherwise indicated.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

HG-200.2-CVAA-WT Soil Mercury in Soil by CVAAS EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MET-200.2-CCMS-WT Soil Metals in Soil by CRC ICPMS EPA 200.2/6020A (mod)

Soil/sediment is dried, disaggregated, and sieved (2 mm). For tests intended to support Ontario regulations, the <2mm fraction is ground to pass through a 0.355 mm sieve. Strong Acid Leachable Metals in the <2mm fraction are solubilized by heated digestion with nitric and hydrochloric acids. Instrumental analysis is by Collision / Reaction Cell ICPMS.

Limitations: This method is intended to liberate environmentally available metals. Silicate minerals are not solubilized. Some metals may be only partially recovered (matrix dependent), including Al, Ba, Be, Cr, S, Sr, Ti, Tl, V, W, and Zr. Elemental Sulfur may be poorly recovered by this method. Volatile forms of sulfur (e.g. sulfide, H2S) may be excluded if lost during sampling, storage, or digestion.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

MOISTURE-WT Soil % Moisture CCME PHC in Soil - Tier 1 (mod)

PAH-511-WT Soil PAH-O.Reg 153/04 (July 2011) SW846 3510/8270

A representative sub-sample of soil is fortified with deuterium-labelled surrogates and a mechanical shaking technique is used to extract the sample with a mixture of methanol and toluene. The extracts are concentrated and analyzed by GC/MS. Results for benzo(b) fluoranthene may include contributions from benzo(i)fluoranthene, if also present in the sample.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

PH-WT Soil pH MOEE E3137A

A minimum 10g portion of the sample is extracted with 20mL of 0.01M calcium chloride solution by shaking for at least 30 minutes. The aqueous layer is separated from the soil and then analyzed using a pH meter and electrode.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

SAR-R511-WT Soil SAR-O.Reg 153/04 (July 2011) SW846 6010C

A dried, disaggregated solid sample is extracted with deionized water, the aqueous extract is separated from the solid, acidified and then analyzed using a ICP/OES. The concentrations of Na, Ca and Mg are reported as per CALA requirements for calculated parameters. These individual parameters are not for comparison to any guideline.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

TOC-R511-WT Soil TOC & FOC-O.Reg 153/04 (July CARTER 21.3.2

2011)

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

Soil

Sum of Xylene Isomer

CALCULATION

Concentrations

Total xylenes represents the sum of o-xylene and m&p-xylene.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code Laboratory Location WT ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid weight of sample

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory. UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined data quality objectives to provide confidence in the accuracy of associated test results.

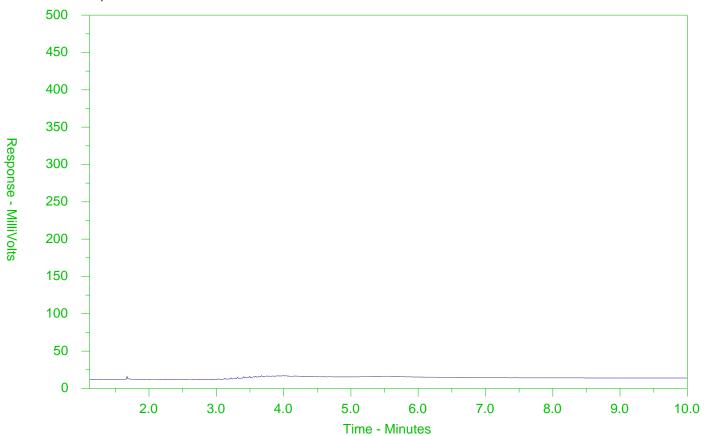

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Gasolin	e →	← N	Notor Oils/Lube Oils/Grease	-						
←	-Diesel/Jet	◆ Diesel/Jet Fuels →								

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

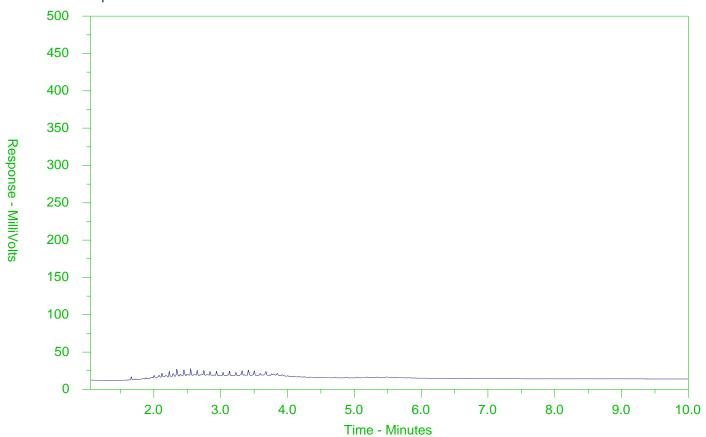

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

Reference Information

Sample Parameter Qualifier key listed:

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
RRR	Refer to Report Remarks for issues regarding this analysis
SAR:M	Reported SAR represents a maximum value. Actual SAR may be lower if both Ca and Mg were detectable.
SURR-ND	Surrogate recovery marginally exceeded ALS DQO. Reported non-detect results for associated samples were deemed to be unaffected.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**			
B-HWS-R511-WT	Soil	Boron-HWE-O.Reg 153/04 (July 2011)	HW EXTR, EPA 6010B			

A dried solid sample is extracted with calcium chloride, the sample undergoes a heating process. After cooling the sample is filtered and analyzed by ICP/OES.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CN-WAD-R511-WT Cyanide (WAD)-O.Reg 153/04 (July MOE 3015/APHA 4500CN I-WAD

The sample is extracted with a strong base for 16 hours, and then filtered. The filtrate is then distilled where the cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

CR-CR6-IC-WT SW846 3060A/7199 Hexavalent Chromium in Soil

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Method 7199, published by the United States Environmental Protection Agency (EPA). The procedure involves analysis for chromium (VI) by ion chromatography using diphenylcarbazide in a sulphuric acid solution.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

EC-WT Soil Conductivity (EC) **MOEE E3138**

A representative subsample is tumbled with de-ionized (DI) water. The ratio of water to soil is 2:1 v/w. After tumbling the sample is then analyzed by a conductivity meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

F1-F4-511-CALC-WT Soil F1-F4 Hydrocarbon Calculated CCME CWS-PHC, Pub #1310, Dec 2001-S Parameters

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

Hydrocarbon results are expressed on a dry weight basis.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.

In samples where BTEX and F1 were analyzed, F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
- 3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:

- 1. All extraction and analysis holding times were met.
- 2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
- 3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.

Reference Information

L2333129 CONTD....

PAGE 31 of 32

Version: FINAL RE\

4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-511-WT

Soil

F1-O.Reg 153/04 (July 2011)

E3398/CCME TIER 1-HS

Fraction F1 is determined by extracting a soil or sediment sample as received with methanol, then analyzing by headspace-GC/FID.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

F2-F4-511-WT

Soil

F2-F4-O.Reg 153/04 (July 2011)

CCME Tier 1

Petroleum Hydrocarbons (F2-F4 fractions) are extracted from soil with 1:1 hexane:acetone using a rotary extractor. Extracts are treated with silica gel to remove polar organic interferences. F2, F3, & F4 are analyzed by GC-FID. F4G-sg is analyzed gravimetrically.

Notes:

- 1. F2 (C10-C16): Sum of all hydrocarbons that elute between nC10 and nC16.
- 2. F3 (C16-C34): Sum of all hydrocarbons that elute between nC16 and nC34.
- 3. F4 (C34-C50): Sum of all hydrocarbons that elute between nC34 and nC50.
- 4. F4G: Gravimetric Heavy Hydrocarbons
- 5. F4G-sg: Gravimetric Heavy Hydrocarbons (F4G) after silica gel treatment.
- 6. Where both F4 (C34-C50) and F4G-sg are reported for a sample, the larger of the two values is used for comparison against the relevant CCME quideline for F4.
- 7. F4G-sg cannot be added to the C6 to C50 hydrocarbon results to obtain an estimate of total extractable hydrocarbons.
- 8. This method is validated for use.
- 9. Data from analysis of validation and quality control samples is available upon request.
- 10. Reported results are expressed as milligrams per dry kilogram, unless otherwise indicated.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

F4G-ADD-511-WT

Soil

F4G SG-O.Reg 153/04 (July 2011)

MOE DECPH-E3398/CCME TIER 1

F4G, gravimetric analysis, is determined if the chromatogram does not return to baseline at or before C50. A soil sample is extracted with a solvent mix, the solvent is evaporated and the weight of the residue is determined.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

HG-200.2-CVAA-WT

Soil

Mercury in Soil by CVAAS

EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MEHG-GCAF-VA

Soil

Methylmercury in Soil by GCAFS

DeWild et al. (2004)

This method follows procedures published by DeWild, Olund, Olsen and Tate (2004) for the US Geological Survey (Techniques and Methods 5A-7). Samples are leached with an acidic copper sulphate solution to solubilize methylmercury for inorganic complexes. The methylmercury is then extracted into dichloromethane and then an aliquot is back extracted into ultra-pure water. The extract is analyzed by aqueous phase ethylation, purge and trap, desorption and GC separation. The separated species are then pyrolized to elemental Hg and quantified by cold vapour atomic flourescence spectroscopy. Results are reported "as MeHg".

MET-200.2-CCMS-WT

Soil

Metals in Soil by CRC ICPMS

EPA 200.2/6020A (mod)

Soil/sediment is dried, disaggregated, and sieved (2 mm). For tests intended to support Ontario regulations, the <2mm fraction is ground to pass through a 0.355 mm sieve. Strong Acid Leachable Metals in the <2mm fraction are solubilized by heated digestion with nitric and hydrochloric acids. Instrumental analysis is by Collision / Reaction Cell ICPMS.

Limitations: This method is intended to liberate environmentally available metals. Silicate minerals are not solubilized. Some metals may be only partially recovered (matrix dependent), including Al, Ba, Be, Cr, S, Sr, Ti, Tl, V, W, and Zr. Elemental Sulfur may be poorly recovered by this method. Volatile forms of sulfur (e.g. sulfide, H2S) may be excluded if lost during sampling, storage, or digestion.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

METHYLNAPS-CALC-WT Soil

ABN-Calculated Parameters

SW846 8270

MOISTURE-VA

PAH-511-WT Soil PAH-O.Reg 153/04 (July 2011)

SW846 3510/8270

A representative sub-sample of soil is fortified with deuterium-labelled surrogates and a mechanical shaking techniqueis used to extract the sample with a mixture of methanol and toluene. The extracts are concentrated and analyzed by GC/MS. Results for benzo(b) fluoranthene may include contributions from benzo(j)fluoranthene, if also present in the sample.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011), unless a subset of the Analytical Test Group (ATG) has been requested (the Protocol states that all analytes in an ATG must be reported).

PH-WT

Soil

nН

MOEE E3137A

A minimum 10g portion of the sample is extracted with 20mL of 0.01M calcium chloride solution by shaking for at least 30 minutes. The aqueous layer is separated from the soil and then analyzed using a pH meter and electrode.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

SAR-R511-WT

Soil

SAR-O.Reg 153/04 (July 2011)

SW846 6010C

A dried, disaggregated solid sample is extracted with deionized water, the aqueous extract is separated from the solid, acidified and then analyzed using a ICP/OES. The concentrations of Na, Ca and Mg are reported as per CALA requirements for calculated parameters. These individual parameters are not for comparison to any guideline.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

VOC-1,3-DCP-CALC-WT Soil

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid weight of sample

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory. UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Hold Time Exceedances:

	Sample						
ALS Product Description	ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
Moisture content							
	16	20-AUG-19 15:25	09-SEP-19 13:59	14	20	days	EHT

Legend & Qualifier Definitions:

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes. Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2333129 were received on 21-AUG-19 14:30.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

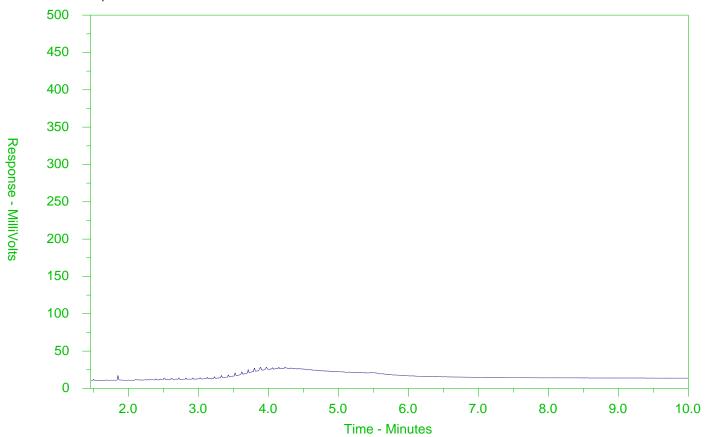

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.

The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.
